Table of Tables

Table 1: Cultural Heritage Significance of Beaumont Bridge..................................................... 49
Executive Summary

Opus International Consultants Limited (Opus) has been commissioned by the NZ Transport Agency to prepare a Heritage Significance Assessment for the Beaumont Bridge, State Highway 8 (SH8), Clutha District. This Assessment will form part of a Detailed Business Case (DBC) that assesses the existing bridge and identifies options for replacement. It is intended to provide insights regarding the history and development of both the Beaumont Bridge and local Beaumont community, and identify and assess their cultural heritage values.

Opened for use in 1887, the Beaumont Bridge consists of three wrought iron truss spans supported on concrete piers. It was the first of four iron truss bridges made entirely from ironwork assembled in New Zealand. The bridge now forms part of SH8 through Central Otago. It is listed as a historic structure in Clutha District Council’s Register of Heritage Buildings, item no. H61; but is not listed with Heritage New Zealand Pouhere Taonga.

Erected in the location of a punt that formed part of a vital access route into the Upper Clutha, in place of an earlier bridge that had washed away, the Beaumont Bridge has exceptional historic value that is intrinsically tied to the development of the Beaumont settlement. This historic value is heightened by connections to prominent Public Works Department engineers and contractors who were influential across the country.

While the structure is simple, it is well executed, and retains much of its original fabric. Where additions or repairs have been made, these have been carried out with sympathy to the original design, and have become an important part of the extant structure which. At 130 years old, and believed to be the oldest road bridge of its kind remaining in New Zealand, the Beaumont Bridge is a vital contributor to our national engineering history; and has the potential, through further investigation and interpretive material, to be a source of information for research and public education.

Based on this assessment, it has been concluded that the Beaumont Bridge has high aesthetic and cultural value, and exceptional historic, contextual, technological, scientific and archaeological value; and the settlement of Beaumont has exceptional cultural, archaeological, historic and social value.

Based on the likelihood that the Beaumont Bridge will be recommended for replacement as part of the DBC, the following recommendations are made:

- the Beaumont Bridge should be retained;
- a new use should be found for the Beaumont Bridge;
- this new use should take advantage of existing opportunities such as cycle trails;
- repair works necessary to make the bridge suitable for the selected alternative use should be carried out;
- replacement bridge options should consider the heritage significance of both the existing bridge and the Beaumont settlement;
- a Conservation Management Plan for the Beaumont Bridge should be prepared;
- an Archaeological Assessment for the Beaumont Bridge and the wider area to be affected by works to repair and/or replace the bridge.
1 Introduction

1.1 Purpose of this Heritage Assessment

Opus International Consultants Limited (Opus) has been commissioned by the NZ Transport Agency to prepare a Heritage Significance Assessment for the Beaumont Bridge, State Highway 8 (SH8), Clutha District.

Although the Beaumont Bridge does not present an immediate public safety risk, the NZ Transport Agency is unable to retain confidence in the long term serviceability of the structure. Therefore, a Detailed Business Case (DBC) that assesses the existing bridge and identifies options for replacement is to be developed. This Heritage Significance Assessment has been prepared as part of the DBC to give insights regarding the history and development of both the Beaumont Bridge and local Beaumont community, and identify and assess their cultural heritage values.

1.2 Ownership Details

The Beaumont Bridge is currently administered by the NZ Transport Agency.

1.3 Heritage Status

The Beaumont Bridge is scheduled as a historic structure in Clutha District Council’s Register of Heritage Buildings, item no. H61.

The Beaumont Bridge is recognised with an IPENZ Heritage Record, administered by the IPENZ Engineering Heritage Board.¹

The Beaumont Bridge is not on the New Zealand Heritage List maintained by Heritage New Zealand Pouhere Taonga (HNZPT).

1.4 Information Used to Prepare this Assessment

1.4.1 Site Inspection

An inspection of the bridge and site was undertaken by conservation architect Chessa Stevens on 1 September 2016 for the purposes of assessing heritage significance and making a photographic record.

1.4.2 Documentation

In addition to those texts listed in the Bibliography, the following documents have been used to inform this Heritage Assessment:

- *SH8 Beaumont Bridge HPMV Strengthening* PowerPoint presentation prepared by Opus International Consultants, 2015;

¹ The Record is a means of capturing information regarding items of engineering heritage interest. Items may be elevated to the Register by IPENZ where they are considered to have “outstanding or special heritage significance”. IPENZ (nd) www.ipenz.org.nz/heritage/
1.5 Constraints and Limitations

The following constraints should be noted:

- Only the documents listed in the Bibliography and 1.4.2 above have been consulted in preparing this Heritage Significance Assessment.
- This Heritage Significance Assessment does not comprise a fabric condition assessment. Only a visual observation of the condition of bridge was undertaken. No invasive testing or analytical investigation has been carried out for the purpose of preparing this Assessment. Information gathered during regular bridge inspections has been used as a reference.
- This Heritage Significance Assessment does not comprise a structural or safety assessment, or contain any kind of engineering advice.
- While this Heritage Significance Assessment considers archaeological values it does not comprise an Archaeological Assessment. This can only be prepared by an appropriately qualified archaeologist.
- Ongoing use or adaptive reuse of the bridge are not discussed at length in this Heritage Significance Assessment. It is understood that the DBC will consider removing vehicle traffic from the bridge and adapting it as a pedestrian and cycleway, and this is discussed in the Recommendations.
- Public engagement will be carried out as part of the DBC. No consultation with stakeholders or affected parties will be carried out as part of preparing the Heritage Significance Assessment.
- This Heritage Significance Assessment does not present the views or history of tangata whenua regarding the cultural significance of the place. These are statements that only tangata whenua can make.
- This Heritage Significance Assessment will not be used as part of any consent or statutory authority application.

1.6 Nomenclature

Many of the places and structures referred to in this Assessment have been known by more than one name, as indicated below. The names given on the left are the names that are used throughout this Assessment.

Beaumont (township) Dunkeld, Beaumont Bridge
Clutha River Molyneux River, The Molyneux

The Maori name for the Clutha River, from its source to the sea, is Mata-au.\(^2\)

\(^2\) Loosely translating to mean “surface current” McLintock (1966) www.teara.govt.nz
2 History of the Site and Structure

2.1 The Site

2.1.1 Description of the Site

Beaumont is a small rural town located on the banks of the Clutha River in Otago, approximately 75 km west of Dunedin (Figure 1). The town consists of a small number of residential dwellings on large sections, and a pub.

The Beaumont Bridge spans the Clutha River at the north end of the town, connecting the two sides of the settlement (Figure 3). The bridge forms part of State Highway 8 which runs in a loop through the Mackenzie Basin and Central Otago, connecting with State Highway 1 at both ends. The road connects Beaumont with the larger towns of Lawrence to the southeast and Roxburgh to the northwest.

Figure 2: Map showing the location of Beaumont Bridge in relation to key roads and waterways.
Source: nzfishing.com
2.1.2 History of the Site

Archaeological research suggests that Maori presence in central and southern Otago dates back at least as far as the 13th century, and that the area was an important focus of activity during the Archaic (or moa hunting) period.\(^3\) Summarised histories prepared by community groups and local authorities\(^4\) refer to the seasonal explorations and establishment of river trails through inland Otago by early Maori; and particularly to mahinga kai trails along the Mata-au (Clutha River).

According to the Central Otago District Council:

The Mata-au [Clutha River] marked the boundary between Ngāi Tahu and Ngāti Mamoe. Ngāi Tahu held the mana over the land north of the Mata-au and Ngāti Mamoe south. Eventually the division was overcome with union between the two tribes. For Ngāi Tahu the Mata-au was part of a mahinga kai trail that led inland used by Otakou hapu including Ngāti Kuri, Ngāti Ruahikihiki, Ngāti Huirapa and Ngāi Tuahuriri.5

Archaeological discoveries of stone quarries, as well as tools, sharpening stones, feathers and bones indicate that these trails were also used to collect materials such as argillite, transport pounamu to and from the west coast, and hunt Moa. During these explorations, campsites or seasonal settlements were established; and the remains of such sites have been found near Beaumont.6 These were recognised from the earliest days of European Settlement, with one of the first stations to be established being named Oven Hills Station, referring to the high concentration of Maori ovens on the land.7 Urupa (burial places), tauranga waka (landing places), and battlegrounds have also been found along the Mata-au.8

Very little is known of the use of the interior of southern New Zealand after the extinction of the moa [14th century] and it is possible that Central Otago was more or less abandoned until shortly before European contact.9

The coastline of Otago was recorded by Captain James Cook during his navigation of New Zealand aboard Endeavour in 1770. Molineux’s Harbour – the mouth of the dual branches of the Clutha River (Figure 2) - was named for Robert Molineux, the Endeavour’s sailing master. However, Cook did not land in the area. The first contact between local Maori and Europeans is understood to have come sixty years later, when the American sea captain and explorer Benjamin Morrell visited Molineux’s Harbour in 1830.10 In his disputed memoir, A Narrative of Four Voyages, Morrell refers to the harbour as “Molyneux” Harbour, and describes visiting a local Maori settlement inland from the harbour on the banks of the river.11

It is by combination of these events that the Clutha River and wider area became known as “the Molyneux” as McLintock (1966) explains:

The early whalers and settlers of South Otago called the [Clutha] river and the district the Molyneux, and the name survived well into the gold mining era. It has often been stated that Cook gave the name Molyneux to the river, but this is incorrect for he never saw it ... The correct name is the Clutha, first suggested in 1846 when the Scottish emigrants were preparing to settle in Otago.12

Clutha is derived from Cluaidh, the Scots Gaelic name for the River Clyde in Glasgow, Scotland.13

In 1853, the 23-year-old Nathanael Chalmers was the first European to venture up the Clutha River. Chalmers had first arrived in Otago in 1849 with his brother G. A. Chalmers; and, after a brief attempt at gold mining in Australia, returned to Invercargill from where he assisted in driving a mob of cattle overland to Dunedin. On this journey he met the Maori chief Reko, who agreed to take Chalmers inland to the north in search of good farming country. Travelling on foot, he was guided by Reko and another Maori chief, Kaikoura, from Tuturau, southwest of Gore, up to Lake Wakatipu and beyond. When Chalmers became ill with dysentery Reko and Kaikoura constructed a flax raft or mokihi, and travelled down the Clutha River back to European company, passing through the sites of later European settlement including Beaumont.14

Explorer-surveyor John Turnbull Thompson was appointed to the position of chief surveyor of Otago following his arrival in New Zealand in 1856. Up until this time, only the coast of Otago had been mapped.

... Thomson accepted the challenge of exploring and mapping this huge territory... During 1857 and early 1858 he carried out his marathon reconnaissance survey of Otago, covering the whole province on horseback in a series of sweeps that took him as far west as the Waiau River and as far north as Mt. Cook ... As a result of his survey the first map of the interior of Otago was published in 1860.15

In the same year as Thomson began his surveys, European run holders began to explore the Upper Clutha valley in search of land suitable for establishing new sheep runs. Several large stations were soon established along the Clutha River, including: Bellamy Station, the starting point for run pioneers heading further into the Upper Clutha; Beaumont Station of over 30,000 acres on the eastern side of the river, named for Beaumont Burn on its southern boundary; Dunkeld Station, across the river from Beaumont Station; and Moa Flat Station of over 71,000 acres on the western side of the river.16

In conducting his survey, Thomson named several areas after places in his home country of Scotland.17 Beaumont township, which was established at the location of a natural river crossing on the borders of Bellamy, Beaumont and Dunkeld Stations, was originally named by Thomson as “Dunkeld”, a Gaelic name from Perthshire.18 However, the Beaumont Burn quickly became familiar to local residents and travellers, who inevitably began to refer to the area as “the Beaumont”.19

Following the discovery of gold at nearby Gabriel’s Gully in May 1860, miners and prospectors began exploring the lower and upper Clutha en masse, and the river crossing at Beaumont quickly became vital. An account of Beaumont’s history given by the website of the Beaumont Residents Group states that the first Beaumont punts operated from 1860;20 however, an article in the Otago Daily Times in 1864 states that various private applications to put punts in place at Beaumont and

16 Webster (1948) pp13-17. According to Webster, Moa Flat was owned by G. A. Chalmers, who brought sheep in from Australia by ship, landing them at Port Molyneux and driving them “up the roadless country” to the station. When Chalmers got into financial difficulty he borrowed from Joseph Clarke, a Tasmanian farm manager and shareholder in the Colonial Bank. Clarke took possession of the station when G. A. Chalmers failed to meet his financial commitments, and dispatched John Fry Kitching from Tasmania to manage the station. A biography of Clarke is given at adb.anu.edu.au/biography/clarke-joseph-3342. Kitching went on to be heavily involved in the development of Beaumont, as explained further in this section.

19 Hands off Beaumont (2009) handsoffbeaumont.blogspot.co.nz. Beaumont is French for “beautiful mountain”. How the Beaumont Burn came to be named has not been discovered in the course of this research.
20 Hands off Beaumont (2009) handsoffbeaumont.blogspot.co.nz
Teviot had been turned down by the Government on the grounds that they were about to undertake the works.\textsuperscript{21} It is evident that a punt was operating by 1868, when the lessee, Mr Botwell, requested that the approaches to the punt be repaired.\textsuperscript{22}

From 1863, Beaumont was also the head of navigation for steam-powered trading vessels travelling up the river from Balclutha.\textsuperscript{23} In this same year, gold dredging on the river was pioneered near the settlement as alluvial gold became scarce;\textsuperscript{24} though it was not until the 1890s that dredging became a popular method of sourcing gold.

By 1870, there were three hotels catering for travellers in the settlement – the Crookston, the Beaumont Ferry and the Duke of Edinburgh;\textsuperscript{25} the Beaumont Racecourse was opened; and the last town sections were put up for sale by auction at a cost of £5.\textsuperscript{26} The earliest survey map of the area that has been sourced in preparing this assessment is dated 1871 (Figure 8). Development continued throughout the 1870s, with the opening of a church and the school.

Around this time, a traveller through Beaumont observed: that several new buildings or improvements were in the course of erection. Mr. Cowap is having a commodious hotel built on the site of the old house, and I have no doubt the establishment will prove highly convenient to all travellers. My consternation may be imagined when I was informed that there was very little chance of my getting across [the river] as the high wind rendered the passage dangerous; however ... I was safely ferried over the broad bosom of the Molyneux.\textsuperscript{27}

As this passage implies, the Beaumont punt was vulnerable to weather conditions and could be unreliable, leading to calls for the construction of a bridge.

Figure 6: Punt crossing the Clutha River at Beaumont, date unknown. Source: bp.blogspot.com
The first bridge at Beaumont was privately commissioned by William Hayes in 1873, and constructed by David McDonald.\textsuperscript{28} Supported by stone piers and abutments set onto rock, this bridge had six spans constructed in timber: two of 16 metres at each end, being “ordinary undertrussed girders”; and two of 30 metres in the centre, “built on the lattice girder principle”. The cost of construction was approximately £7,000.\textsuperscript{29}

While construction commenced at pace, significant delays were caused when the wire rope used to convey the blocks of stone from the river banks to the piers snapped only a few months into the project.\textsuperscript{30} However, McDonald executed the installation of the 30 metre-long bridge girders without incident; and the bridge was opened to foot traffic in September 1874.\textsuperscript{31} While it was not heralded for its architectural beauty, the bridge was evaluated by the public as an imposing structure with “a look of strength and durability”.\textsuperscript{32}

The construction of roads in the area was slow, and McDonald and his team were forced to build their own tracks to get materials to the bridge site. Roads connecting with the bridge were surveyed in 1874, and construction then began on the approaches. However, these remained incomplete when the bridge was opened to pedestrians; and it was not until November 1874 that the eastern approach, which had to be built up by approximately 10 metres, was passable for traffic.\textsuperscript{33}

It was expected that traffic on the road through Beaumont would be substantially increased as a result of the erection of the bridge; however, the slow construction of adequate roads servicing the area restricted use of the route, and therefore the bridge. The comparatively low cost of the punt, and the lack of facilities such as a hotel and paddocks for resting animals at the site, also contributed to the poor uptake in use of the bridge.\textsuperscript{34}

In 1875 Hayes placed the bridge on the market; and, in 1876, it was sold to the New Zealand Loan Company who on-sold it to J. F. Kitching.\textsuperscript{35} Kitching also purchased the punt. With his ownership over both methods of river crossing secured, Kitching increased the bridge tolls. This caused widespread complaint; however, Kitching refused to lower his prices, stating that the bridge being private property and he was entitled to charge as he pleased.\textsuperscript{36} Kitching also constructed a new hotel at the bridge – the Bridge Hotel – along with his own stables and outbuildings.\textsuperscript{37}

Towards the end of 1877 the Tuapeka County Council began investigating the purchase of the bridge; and the Government agreed to contribute the sum of £5,000 to the cost. While there was some dispute over the state of the bridge – particularly the extent of rot in the main timbers – and Kitching made it clear that he would not accept an offer of £5,000, the Council pursued the purchase. This had the general support of the community who were in favour of removing the tolls opening the bridge for free traffic.38

Before any purchase could be agreed, however, the Clutha River experienced severe flooding. On 27 September 1878, the water was reported as being right up to the roadway of the bridge, which was “shaking in a most dangerous manner”.39 On 28 September, the Tuapeka Times reported that one of the piers and the abutments on the Lawrence side of the bridge had been carried away, and one of the “principal beams” of the bridge was cracked.40 Floodwaters subsided briefly, but began to rise again on the morning of 30 September; and the centre of the bridge was washed away that afternoon.41 The Evening Star described the event:

Mr Jacob Davidson, with a buggy, was the last person to cross, and just as he landed on the Lawrence side the bridge went away in two pieces. Both sections of the superstructure sailed away down the river, locking like two large punts. One stone pier was carried away, and there are two apparently sound... The telegraph line crossing the river is broken and cannot be repaired, as there is no boat available, and it is questionable if one could live in such a torrent... Beaumont town is partly under water. Some of the residents cleared out last night. No communication can be held verbally with the opposite bank, owing to the high wind.42

Several other bridges over the Clutha were also washed away in the flood.

Under the instruction of the County Engineer, work to construct a free punt across the river at the site of the bridge was commenced as a temporary measure while the re-erection of the bridge was discussed. However, Kitching, with his own punt back in operation, quickly asserted his right to both banks of the river for three miles either side of the bridge site. The Council conceded, and ceased construction of the free punt, while Kitching once again began to charge exorbitant tolls.43

With the loss of the bridge, and the high cost of the punt, traffic between Dunedin and Alexandra, Clyde, Cromwell, Cardrona, and other goldfields in the area was diverted to other roads, and local businesses in Beaumont began to suffer.44 At a public meeting in March 1879, the Council agreed to offer Kitching the sum of £3,000 for purchase of the bridge site including the punt;45 however, negotiations between the two parties failed to result in an agreement.

In late 1879, the community petitioned the Government to re-erect the bridge, or to force the Council to do so.46 In response, the Parliamentary Public Petitions Committee stated that the Government had already agreed to contribute £5,000 for the purchase of the previous bridge, £3,000 of which had already been advanced to the Council for this purpose. Further, the Public Petitions Committee noted, the £3,000 had not yet been used to make the purchase, and they

recommended the Government take immediate action to recover the money. Simultaneously, the New Zealand Loan and Mercantile Agency Company began demanding payment of the agreed £3,000 with interest on Kitching’s behalf.

The Tuapeka County Council finally paid to Kitching, with interest, the sum of £3,000 to purchase the land associated with the former bridge and existing punt in January 1880. The County Engineer, William Smaill, estimated the cost of constructing a new bridge in the same location at just over £7,000. The Council resolved to call for tenders for the construction of a new bridge on the basis that the Government’s offer to contribute £2,000 to the cost of construction was secured. The Council was also faced with the cost of repairing roads and other bridges throughout the district following the floods, and finances were tight.

In February 1880, John McCormick, who had erected two bridges over the Kawarau River and was, at the time, erecting another on the Queenstown Road, made an offer to the Council to construct this bridge in iron imported from England, to plans and specifications prepared by “a competent Engineer”. However, his offer was rejected by the Council on the grounds that no plans or specifications were presented to show the style, materials, height or width of the bridge; and his price was too high. This caused considerable debate within the Council, especially as some councillors considered it likely that the Government’s offer to contribute a further £2,000 to the cost of the bridge would soon lapse.

The Government did not withdraw the funds; however, a letter from Public Works Office to the County Council in April 1880 confirmed that they would not enter into any agreement to provide the money unless and until the expenditure of money already advanced had been properly accounted for.

In May 1880 a second offer to construct the bridge was made to the Council, this time by R. Campbell & Co of Dunedin; and, like McCormick’s offer, this was declined.

The Council continued to seek payment of the £2,000 from the Government; and, in June 1880, a deputation was put before the Minister of Public Works. The Minister responded that the Government “would be prepared to pay it as a first progress payment on the Council entering into a contract for the re-erection of the bridge”. Still an agreement between the two parties could not be reached, with many councilors arguing that the County did not have the necessary funds to make its contribution; especially given the high cost of maintaining the roads in the area. Motions by pro-bridge councilors to call for tenders to construct the bridge were repeatedly lost to those who were against. Letters were exchanged between the Council, the Department for Public Works, and Treasury; but the Government remained unmoved. Meanwhile, the punt continued to operate at what many members of the community considered to be an unreasonably high cost.

Finally, the Council was advised to apply for assistance under the newly passed Roads and Bridges Construction Act 1882 for the balance of funds; and, after the Council applied for a much higher sum of £7,000 the Government agreed to contribute £6,000; however, this was also to cover the cost of re-erecting another bridge over the Clutha River at Roxburgh.\textsuperscript{60} Plans and specifications for the Beaumont Bridge, were received by the Tuapeka County Clerk in April 1883; and the first tenders were called for its construction.\textsuperscript{61}

Construction of the Beaumont Bridge was carried out under two contracts: the first for the piers and abutments; and the second for the superstructure. The first contract commenced in September 1883 and was set down for completion in January 1884; however, for reasons discussed in Section 2.2.1 it was not until mid-1885 that the piers and abutments were complete and construction of the superstructure was able to commence.

During this time, the punt continued to ferry passengers, vehicles, and stock across the river at Beaumont.\textsuperscript{62} In November 1886, it overturned, throwing the punt man, three passengers, and a wagon of goods drawn by four horses, into the river. Men working on the Beaumont Bridge witnessed the accident, and managed to rescue three of the four passengers from downstream. The forth passenger, a nine year old girl, was unable to be rescued.\textsuperscript{63} The punt reopened within a few weeks; however, the accident led some to believe that the state of the punt had been neglected by the Council due to the imminent completion of the bridge.\textsuperscript{64}

The Beaumont Bridge officially opened in March 1887, by which time the township of Beaumont had a store, butchery, bakery, blacksmith, and post office, in addition to the hotels, church and school.\textsuperscript{65} With the opening of the bridge, the punt was finally closed.\textsuperscript{66} This was a relief to the Council, who, by ruling of the Supreme Court, were held responsible for the punt accident.\textsuperscript{67} To recoup the resulting financial losses, the Council proposed to charge waggoners a toll for crossing the new Beaumont Bridge.\textsuperscript{68} Not surprisingly, this proposal was not viewed favourably, and the matter was later dropped.\textsuperscript{69}

Land on either side of the bridge, held in reserve, then became the subject of community debate, with the Land Board resolving to keep some in reserve, with a remainder being surveyed into one acre lots and offered for sale. The land held back was leased periodically to locals for pastoral purposes.

Beaumont boomed in the 1890s with the arrival of steam-powered and then electric-powered gold dredges to the Clutha. In 1895, a correspondent for the *Tuapeka Times* reported:

> The Molyneux and the Beaumont are now attracting the attention of the mining public. The local Co-operative Hydraulic Sluicing Co., whose claim is located a little above the Beaumont bridge, have started the cutting of their headrace. Two parties have contracted for over three-fifths of the entire length... This claim has the reputation of having a very rich run of wash (an old bed or channel of the river) running through it. This channel or riverbed was followed by a party of miners in the sixties till they were bested by water... Two licensed holdings are also applied for, one above the Beaumont bridge and one below, and it now remains only a matter of time when the whole of this hitherto neglected, portion of the river will be taken up for dredging purposes.

Similar reports continued throughout the late 1890s, as reported in the *Otago Witness*:

> The Tuapeka Dredging Company, whose claim is above the Beaumont bridge, are very reticent as to their returns. I was privileged, however, at their last week's wash-up to get; the yield handed to me for my judgment as to weight, and it was heavy, considering the ancient and out-of-date dredge they have to work with. This party, I understand, are negotiating for a new and powerful dredge to supplant their present one, and when this is achieved something phenomenal in the way of returns is expected.

> In January of this year [1897] three dredging claims were taken up in the Molyneux River – seven, nine and 12 miles respectively – below Beaumont bridge ... the area of each of the claims is 50 acres, and the total capital proposed to be invested is £19,000.

It has been estimated that approximately 150 gold-dredges were active on the Clutha River during the 1890s. By the turn of the century the boom had reached its high point, and slowly began to decline; though dredging continued on the Clutha for several decades leading to a second, smaller boom in the 1930s.

In 1905, construction of a long awaited extension of the railway line from Lawrence, through Beaumont to Roxburgh, commenced. It was hoped that, by making access to the Upper Clutha easier, industries other than gold mining and sheep farming would begin to prosper – particularly the industry of fruit growing.\textsuperscript{78} However, construction of the line was slow, taking almost ten years to reach Beaumont.\textsuperscript{79} By this time, the local population had lost all expectation that the line would ever reach Roxburgh; and, instead, began to demand that the main road be made suitable for motor vehicles.\textsuperscript{80} Never-the-less, construction continued and, during the following decade, the population of Beaumont reached its highest point as railway workers and their families took up residence. Beaumont remained the terminus of the branch line until 1925 when the extension to Millers Flat finally opened.\textsuperscript{81} The line did not reach Roxburgh until 1928, by which time it was not just fruit growing, but also forestry, that had become established industries in Beaumont.\textsuperscript{82}

These industries saw Beaumont through the Great Depression.\textsuperscript{83} The Beaumont Racing Club continued to operate;\textsuperscript{84} and a new hotel was constructed to replace the Bridge Hotel shortly before the outbreak of the Second World War.\textsuperscript{85} This hotel remains operational at the time of preparing this Assessment.

However, closure of the railway branch line in 1968 signalled the start of a significant decline\(^86\) that was exacerbated by the rise of large land holdings, changes in the horticultural sector, and closure of the local forestry headquarters. During the 1980s, the Racing Club and the school were officially closed.\(^87\) The school house remains extant today, though it is evident that it has been considerably modified over the course of its life. The racecourse has been utilised for horticultural purposes.

These factors notwithstanding, an aerial photograph of Beaumont taken in 1955 (Figure 18) indicates that the size of the settlement has changed little since this time. While some homes and farm buildings have been demolished, many remain though may have been extensively modified.

In 1992, the Electricity Corporation of New Zealand (ECNZ) proposed the construction of a dam at Tuapeka Mouth that would flooded 3,000ha of land, including all of Beaumont. Some locals agreed to sell their land; however, others were determined to resist, forming lobby groups including "Hands off Beaumont" to protect the township's “rich history and its attractive and distinctive environment".\(^88\) Plans for this dam, along with others along the Clutha, were officially abandoned in 2012.\(^89\)

The Beaumont Hotel remains open for meals and accommodation, and hosts the annual Beaumont Motorcycle Rally along with other community events.

## 2.2 The Structure

### 2.2.1 Design & Construction

The Beaumont Bridge comprises four concrete piers and two concrete abutments, supporting a superstructure of wrought iron. No specification for the concrete work has been cited in preparing this Assessment; however, it is evident from site inspection that the concrete consists of aggregate of varying sizes which is likely to be river gravel, with low cement content. All concrete work is finished with a cement render, struck out in lines to resemble stonework.

Five spans make up the bridge — three central spans of 115ft (approximately 35m), and two end spans of 58ft 6in (just under 18m) giving a total length of 462ft (approximately 140.8m). Each span is made up of two wrought iron lattice girders, formed by connecting top and bottom chords with channel-section and H-section struts crossed at 45 degrees to form a lattice, finished at each end with a vertical post. Larger girders were required for the longer spans, but both sizes of girder were constructed following the same design principles, increasing in weight from the centre of the spans to the ends without altering the spacing of the braces. The specification for the superstructure works called for the large girders to be fastened down on piers 1 and 4, with the other connections to be “furnished with malleable-iron roller-frames and rollers”. The small girders were to be fastened at the abutments and loose on piers 1 and 4.

The lattice girders are connected with rolled wrought iron I-section transoms (also referred to as cross-girders) placed on the bottom chord of the lattice at every intersection. These cross-girders are braced with horizontal cross-bracing. Every second transom projects beyond the bottom chord, and is tied back to the top chord with a diagonal brace. The transoms provide support for the timber bearers (also referred to as beams or stringers) to which the timber decking is fixed. The specification required all timber to be matai, totara or kauri, and a minimum of “three quarter heart”. A contemporary report stated that the decking was “of best totara from the Southland mills” and “of the most durable quality”. The breadth of the deck is 14ft (approximately 4.3m) which, at the time, was reported as providing enough room to pass. The height of the bridge deck above the average river level was specified in the contract drawings as 30ft (just over 9m) in the hopes of ensuring it would not be susceptible to flooding.

Figure 20: General Elevation of the Beaumont Bridge, 1887.
Note the five spans, the three central spans being larger than the two end spans. The piers were all founded on rock.

90 Contract for Superstructure of the Beaumont Bridge, PWD 12762, Archives New Zealand Ref W5 268.
91 Tuapeka Times, 9 March 1887; Contract for Superstructure of the Beaumont Bridge, PWD 12762, Archives New Zealand Ref W5 268.
92 Tuapeka Times, 9 March 1887.
93 Tuapeka Times, 9 March 1887; Contract for Superstructure of the Beaumont Bridge, PWD 12762, Archives New Zealand Ref W5 268.
The initial plans and specifications for the Beaumont Bridge were prepared by Public Works Department (PWD) engineer, W. N. Blair. These documents were received by the Tuapeka County
Clerk in April 1883; and tenders were called for construction of the concrete piers and abutments. The tenders received initially were considered too high; and it was decided to call for fresh tenders in July. Following receipt of these tenders, the contract for construction of the concrete piers and abutments was awarded to W. R. Buchanan.

While the design of the bridge did not allow the laying of a foundation stone, the first bucket of cement was poured on 21 September 1883 by local MP, Vincent Pyke, a large crowd gathering to witness the ceremony. A time capsule containing local newspapers and coins was placed under the foundation stone; and, following the ceremony, the dignitaries retired for a meal at the Bridge Hotel.

Construction proceeded smoothly until November when, first, an accident, and then heavy flooding, caused some interruption. The accident was described in the Tuapeka Times:

A man named John Boland, employed at the erection of the Beaumont bridge, performed a most wonderful feat and, at the same time, made a most miraculous escape from an immersion in the Molyneux one day last week. Boland, it would appear, was engaged on one of the piers of the bridge in tipping the cement-cage when it came along the rope to the pier; and on one occasion ... after tipping ... he was jerked at once off the pier and left hanging by the one hand in mid-air, about 60 feet above the river. Those standing at the side were almost paralysed for a minute, but realizing the great danger of the situation of their comrade, they at once hit upon the only assistance they could render him, which was to whip up the horse and make the time of suspension as short as possible. Happily a smart, willing horse was at work at the time, and answered the call made upon him at once by bringing Boland speedily ashore, a distance of some 100 yards or upwards.

By Christmas, three bridge piers had been constructed to a height of 10ft above the river, and construction on the abutments had commenced; however, it was becoming apparent that Buchanan would not have the works finished by 31 January 1884 as his contract required. The Tuapeka County Council granted Buchanan an extension to complete the works.

In June, Buchanan requested that the Council appoint a new inspector of works; but the Council refused. Shortly afterwards, works were suspended again due to weather; this time because of severe frosts. Meanwhile, the Government confirmed a grant of £4,500 would be made towards construction of the bridge superstructure. Construction of the piers and abutments extended into 1885. According to an article published in the Tuapeka Times, construction was once again "progressing rapidly" by April. The article continued:

Mr Buchanan's contract for the piers and abutments is fast approaching completion, and the Government is calling for tenders for the superstructure, which will consist of girders of lattice
iron-work and wooden deck. This bridge when finished will be a handsome and substantial structure ... 105

Tenders for the superstructure were received in April 1885; and the tender of John Anderson of Christchurch, being the lowest, was accepted106 and the contract signed.107 In August, the piers and abutments were inspected by government engineer Mr Low who was reportedly “highly pleased with the manner in which the contractor has carried out the work”. The site was officially handed over by Buchanan to the PWD, and by the PWD to Anderson.108

The contract for the superstructure specified that the ironwork was to be manufactured in New Zealand. The contractor was given the option of importing the raw materials; but they had to be imported “exactly in the state in which they left the rolling-mills”.109 Anderson chose to import the iron from England to his foundry in Christchurch110 before transporting it by rail to Lawrence where the branch line terminated. The iron is reported to have arrived in Lawrence in January 1886,111 from where it was carted to the site of the bridge by Messrs Williams and Tubman.112 At the site, Anderson established a small foundry to prepare the raw material.113 Mechanics were dispatched from the Christchurch foundry to carry out the assembly.114

The requirement for locally manufactured ironwork was controversial, with opponents quick to accuse contractors such as Anderson of getting “the work done in England, leaving only the punching of rivet-holes” or the “putting together of pieces” for local industry to achieve, and pocketing the profits.115 The publication of such accusations led Anderson and his representatives to respond:

... in regard to what is being done to the ironwork for the Beaumont bridge, you lead your readers to believe that all the contractor is doing is to punch a few holes and put the work together, the most of the work having been done in Britain, and by that means enriching themselves at the expense of the colony. Now ... I may state that the iron came from the rolling mills, and was laid down on the bridge site in the same state as any engineering firm in Britain would receive it that had a contract of the same kind to do.116

The Government never contemplated the absurdity of requiring contractors to erect rolling mills for the manufacture of the iron. What they specified was that the iron should be imported in the state in which it left the rolling mills, and that condition has been rigidly adhered to. You clearly are under the impression that the contractors imported the iron with certain work done on it, and I must express my surprise that the few inquiries necessary to dispel that illusion were not made by you.117

Following the arrival of the iron, construction of the superstructure proceeded with speed. By May 1886 one span was almost complete; and Anderson was reported to be confident that he would
complete the contract by July as required.\textsuperscript{118} However, this proved to be optimistic. The depth of the river, the strength and the volume of the current, made access difficult, and “it was found necessary to erect a temporary structure of trusses which, to many, had the appearance of a thoroughly permanent work”.\textsuperscript{119} Difficult weather and delays in arrival of timber for construction of the bridge deck caused further issues;\textsuperscript{120} and, despite having approximately thirty workmen onsite, construction of the superstructure extended into 1887.

![Beaumont Bridge in 1887](bp.blogspot.com)

\textbf{Figure 23: Beaumont Bridge in 1887, thought to be around the time of its opening.}
Source: bp.blogspot.com

In February 1887, PWD engineers including W. N. Blair made an inspection of the bridge “to see how the colonial material was turning out” and was reportedly pleased with both the materials and the workmanship. At this time it was also reported that the Beaumont Bridge was one of four bridges underway for which the ironwork was being fabricated in New Zealand.\textsuperscript{121}

On March 7\textsuperscript{th} 1887, the bridge was officially opened. The first crossing was made by Anderson, driving a coach provided by Craig and Co., accompanied by a party of passengers. The men who had been part of the construction assembled on the bridge to cheer the coach as it passed; after which, Anderson treated all of his guests to a champagne luncheon at the Bridge Hotel.\textsuperscript{122}

The IPENZ Record for the Beaumont Bridge summarises its construction succinctly:

> The Beaumont Bridge took one year to construct, but the entire project was three and a half years in the making. When the Beaumont Bridge was eventually completed it was described as “a lasting monument of the undoubted excellence of New Zealand workmanship.”\textsuperscript{123}

Contemporary reports state that over 170 tons (approximately 173 metric tonnes) of wrought iron were used in the construction of the superstructure. The weight of timber used is not mentioned. The iron was finished with three coats of hematite paint, and all joints in the woodwork, and

2.2.2 Alterations & Maintenance Works

Maintaining the Beaumont Bridge proved to be a difficult task for the Tuapeka County Council. According to the published proceedings of a Council meeting in October 1902, the deck of the Beaumont Bridge was already in need of replanking, and the ironwork in need of repainting.\footnote{Tuapeka Times, 11 October 1902} Cleaning and painting works were carried out in 1903;\footnote{Otago Witness, 22 April 1903} however, the decking remained an issue. In January 1906 the County Engineer reported that he had obtained some Jarrah planks to trial on the deck of the bridge.\footnote{Otago Witness, 24 January 1906} A year later, it was reported that a number of bridge decks in the area had split “owing to the exceedingly dry weather” and that this was most noticeable on the Beaumont Bridge “which must be redecked as soon as possible”.\footnote{Tuapeka Times, 12 January 1907} However, it is not until November 1911 that the cost of timber attributed to the Beaumont Bridge appears in the Public Works Engineer’s report.\footnote{Mt Benger mail, 29 November 1911} It is assumed, but not confirmed, that this timber was for redecking purposes.

The bridge withstood serious flooding in October 1912\footnote{North Otago Times, 18 October 1912} and again in 1919.\footnote{Otago Daily Times, 30 June 1919} In June 1920, the Public Works Engineer’s report shows costs of £200 attributable to the Beaumont Bridge, but does not state what these costs are for.\footnote{Tuapeka Times, 12 June 1920}
In 1921 the Council received complaints that the planks of the bridge were loose and spikes were protruding, risking damage to the tyres of motor cars. This followed an earlier communication from the Teviot Motor Lorry Association, received by the Council in 1917, which requested an improvement to the deck, “its present condition being a serious menace” to motorised traffic. By way of reply, the Council Engineer explained:

that the bearers were not as sound as they should be and that they would not hold the spikes, which were frequently being driven down. He did not think there was much in the suggestion that motor tyres were being punctured. However, Mr T. Philipps had his instructions to keep a close watch on the planking and see that the spikes were kept down.

---

Figure 27: Bridge Hotel with vehicles parked outside, 1918.
This image demonstrates the type of motorised vehicles that were regularly using the bridge (located behind the photographer) by this time. Note the vehicle of J. F. Tamblyn in the centre. In 1926, Tamblyn narrowly escaped dropping through the deck of the Beaumont Bridge into the river while repairs were being undertaken.
Source: Hocken Collections Asset ID 6260

The condition of the paintwork was also raised again in 1921, with the Council resolving to apply to the PWD for a £ for £ grant to undertake the works. This application was refused, the Minister of Public Works ruling that it was local work and therefore the Council’s sole responsibility. The Council disputed this, and disagreement between the two parties continued for several years, by

133 Mt Benger Mail, 13 April 1921
134 Mt Benger Mail, 13 April 1921
135 Otago Daily Times, 11 July 1921
which time it was also noted that the bridge required “some new beams” and other repairs to the superstructure.\textsuperscript{136}

In 1924, it was agreed that Council would, again, make a plea to the PWD for a £1 for £1 subsidy on the basis that the painting work was now urgent and would cost approximately £1,000.\textsuperscript{137} The PWD agreed to a subsidy of £1 for £2, with the work to be carried out by PWD staff.\textsuperscript{138} At the Council’s annual meeting on 3 June 1925 it was reported that “the painting and repairing of the understructure of Beaumont traffic bridge by the PWD” was underway.\textsuperscript{139}

The following year, the bridge was completely redecked. In August 1926, the Council Engineer reported:

The re-decking of the big bridge at Beaumont is again in hand and good progress is being made. In this connection I have to report that a lorry laden with clay pipes, owned by Mr J. F. Tamblyn, had a narrow escape of dropping through on to the river bed. The bridge was open for traffic for half its width and the lorry was passing over the old portion of the bridge when the stringers broke, and it was only by speeding up that what might have been a serious accident was averted. I suggest that during the progress of repairs the loads using the bridge to restricted to a reasonable weight.\textsuperscript{140}

The Councillors agreed that load weights should be restricted, and the works were reported as being complete in October 1926.\textsuperscript{141} However, the deck was again proving problematic by 1930, and new running planks were installed. In reporting the completion of this work, the Mt Benger Mail stated:

The placing of the running planks has been completed and this should save the decking for some considerable time. On examination it was found that the bottom flanges of the lower chords were rusting badly, and these are now being cleared and painted with bitumen.\textsuperscript{142}

Despite the hope that the running planks would future-proof the deck, a decision to lay gravel was made in 1935 as a method of postponing redecking which would “soon be necessary”.\textsuperscript{143}

The Beaumont Bridge underwent a programme of strengthening during the 1960s and 70s. It is understood that the king post trusses strengthening each of the transoms were added during this time; first to the long spans, and then to the shorter end spans.\textsuperscript{144}

In 2009, the NZ Transport Agency carried out some repair and maintenance to the Beaumont Bridge. As this work got underway, the Agency announced that it would be investigating the feasibility of replacing the bridge due to the ongoing costs and traffic disruption associated with maintaining the bridge deck and structure.\textsuperscript{145} In 2010, the NZ Transport Agency added permanent traffic signals at each end of the bridge to slow the traffic down and prolong the life of the structure. Niclas Johansson, the Regional State Highways Manager at the time, stated:

\begin{itemize}
  \item \textsuperscript{136} Mt Benger Mail, 16 November 1921; Mt Benger Mail, 26 April 1922; Mt Benger Mail, 28 June 1922
  \item \textsuperscript{137} Otago Daily Times, 13 October 1924
  \item \textsuperscript{138} Mt Benger Mail, 17 December 1924
  \item \textsuperscript{139} Mt Benger Mail, 3 June 1925
  \item \textsuperscript{140} Mt Benger Mail, 18 August 1926
  \item \textsuperscript{141} Otago Daily Times, 29 October 1926
  \item \textsuperscript{142} Mt Benger Mail, 15 October 1930
  \item \textsuperscript{143} Mt Benger Mail, 17 July 1935
  \item \textsuperscript{144} Opus International Consultants (2015a)
  \item \textsuperscript{145} NZ Transport Agency (2009) www.nzta.govt.nz
\end{itemize}
The decision to install the signals was taken to lower vehicle speeds to help reduce stress and wear and tear on the bridge, especially from heavy trucks. The bridge deck timber is also prone to movement and this is aggravated by high traffic speeds.\textsuperscript{146}

Scaffolding erected for earlier repair works remained at the bridge to allow regular monitoring and access for any necessary repairs.\textsuperscript{147}

In October 2011, the \textit{Otago Daily Times} reported that the safety of the Beaumont Bridge was questioned by local government officials at a meeting of the Otago Regional Council's transport committee. The article continued:

The NZTA has been spending money on the bridge as it seeks to extend the life of the 123-year-old structure. About $1.5 million was spent on maintenance during the period 2005-10. A decision on replacing the bridge may be on the back-burner because of the possibility a hydro dam could be built in the area, flooding Beaumont... A new bridge had been earmarked for construction sometime after 2015 ... However, the NZTA was yet to commission any design plans for a new bridge.\textsuperscript{148}

In 2014, repairs to the deck costing $150,000 were carried out.\textsuperscript{149} This was followed in 2015 by strengthening works to enable the bridge to carry High Performance Motor Vehicles (HPMVs) with loads of up to 62 tonnes,\textsuperscript{150} as well as replacement of a damaged strut in one of the lattice girders,\textsuperscript{151} and further deck repairs.\textsuperscript{152} A regular inspection programme continues at the time of preparing this Assessment, with the bridge being periodically closed for strengthening and maintenance works.\textsuperscript{153} The current condition of the structure is varied. The concrete piers appear to be in reasonably sound condition, though there is staining and microbiological growth and some cracking evident. However, the concrete abutments are exhibiting serious signs of failure - particularly the west abutment. The deck is exhibiting signs of wear, with areas of the surface worn away. Below the deck, there is a build-up of dirt and microbiological growth evident on the decking timbers, timber bearers, transoms, horizontal cross braces, and bottom chords of the lattice girders. Recent repairs of connections and fatigued ironwork are evident. Drawings of repair works undertaken in 2015 are provided in Appendix 2.

\textbf{2.2.3 Current Condition}

The bridge remains scaffolded to enable regular inspections. It is estimated that approximately 1,800 vehicles, including HPMVs, cross the bridge each day.\textsuperscript{154} The current condition of the bridge is captured in Figure 28 to Figure 38 below.
Staining, microbiological growth and cracking are visible. Note also the strengthening works that have been carried out.

Serious cracking and delamination of the concrete are visible.
Figure 31: Concrete pier. Staining, microbiological growth, cracking, and graffiti are visible.

Figure 32: Lattice girder behind scaffold. Transom ends are visible, intersecting with bottom chord.

Figure 33: Intersection between small and large lattice girders.

Figure 34: Bridge deck looking west. The poor condition of the deck surface is evident.

Figure 35: Understructure of the bridge showing king post trusses strengthening transoms and cross bracing below timber deck. Microbiological growth and accumulation of dirt is evident.

Figure 36: Recent repair of wrought iron bottom chord.
2.3 Persons and Groups Associated with the Building

2.3.1 W. N. Blair

William Newsham Blair was born in the Scottish Hebrides, immigrating to Dunedin in 1863 when he was in his early 20s. He was first employed by Otago’s Chief Engineer of Roads, then Chief Engineer of Railways, before being appointed as District Engineer to Otago and Southland under the newly created PWD. In this role, Blair was responsible for the construction of all of Otago and Southland’s railways, and many of the roads and bridges.155

When the PWD was divided in 1878, Blair was put in charge of the South Island division (known at the time as Middle Island). It is during this period that he was involved with the Beaumont Bridge. Various contemporary sources credit Blair with preparing the drawings and specifications for the first tender; though documents prepared for the superstructure are credited to John Blackett.156

In February 1887, the Tuapeka Times reported:

Yesterday Mr W. N. Blair, Engineer-in-Chief of the Middle Island, accompanied by Mr Ussher, District Engineer, paid a visit of inspection to the new Beaumont bridge ... The object of Mr Blair’s visit was to see how the colonial material was turning out; and we are pleased to learn that he is thoroughly satisfied, not only with the material, but with the workmanship, which is of a truly excellent character throughout.157

---

155 Williams (updated 2013) www.TeAra.govt.nz
156 Contract for Superstructure of the Beaumont Bridge, PWD 12762, Archives New Zealand Ref W5 268.
157 Tuapeka Times, 16 February 1887
This conflicts with more recent sources, according to which Blair was removed from his South Island (Middle Island) post in 1884 when the PWD reamalgamated, moving to Wellington to take up the role of national Assistant Engineer-in-Chief.\textsuperscript{158}

Whatever the case, it would seem that he succeeded John Blackett as Engineer-in-Chief in 1890, when he was also appointed as Under Secretary of the Department. He held these positions for a year until a long period of illness led to his premature death in 1891. A widely recognised and respected public servant, Blair’s cortege made a public procession from Wellington to Dunedin, where his funeral was held at Knox Church. He is remembered “both for his achievements in engineering and for his capacity to inspire lasting affection”.\textsuperscript{159}

2.3.2 John Blackett

John Blackett was born in Newcastle upon Tyne, England, where he trained and practised as a draughtsman and then as an engineer specialising in ships and mines. He immigrated to New Zealand with his wife in 1851, settling first in Taranaki where they established a farm. Following a short commission as an ensign in the New Plymouth Battalion of Militia, Blackett and his family moved to Nelson where he took up the role of Provincial Engineer, overseeing the construction and maintenance of roads, bridges, wharves, lighthouses, buildings, and the Nelson city waterworks.\textsuperscript{160}

In 1870, Blackett was appointed as the Public Work Department’s acting Engineer-in-Chief, and moved to Wellington. Following the arrival of the new Engineer-in-Chief, Blackett was appointed as Assistant Engineer-in-Chief and Marine Engineer to the general government. In this role he oversaw the erection of fourteen lighthouses. When the PWD was divided in 1878, Blackett was put in charge of the North Island division, becoming Engineer-in-Chief upon reamalgamation.\textsuperscript{161}

Drawings and specifications included in the contract for the construction of the superstructure of the Beaumont Bridge, dated 1885, are attributed to Blackett. Whether the design is attributable to him, or to Blair, is unclear. Given their closely aligned positions within the PWD, it is considered likely that both men were involved with the design.

In 1889, Blackett accepted an appointment as consulting engineer for the New Zealand government in England; and was succeeded as Engineer-in-Chief by W. N. Blair. However, he resigned within a few years because of ill health, returning to Wellington where he died on 8 January 1893.\textsuperscript{162} Blackett made a considerable contribution to infrastructure and marine engineering in New Zealand.

\textsuperscript{162} Orr (updated 2012) www.TeAra.govt.nz/en/biographies
2.3.3 W. R. Buchanan

Little information is available on W. R. Buchanan. It is evident from contemporary newspaper reports and letters to the editor that the quality of Buchanan’s work, and the speed at which construction of the piers and abutments was carried out under his supervision, was a matter of public concern. After the completion of his contract, Buchanan entered a dispute with the Tuapeka County Council, claiming that he had not been paid for construction of coffer dams required to construct the bridge piers;163 and that he had been unfairly maligned for problems that had arisen over the height of the piers themselves.164 The Council asked the Government to make an inquiry into Buchanan’s claims.165 Eventually, almost a year later, the matter was resolved at a council hearing.166

2.3.4 John Anderson (the younger)

John Anderson (the younger) immigrated to New Zealand as a small child with his parents Jane and John Anderson (the elder), arriving in Lyttelton in 1850 and settling in Christchurch. John Anderson (the elder) had trained as a blacksmith, and established a business and home in Cashel Street.

In 1857 the plant of “J. Anderson, Engineer, Millwright, Boiler Maker &c” ... expanded to include a foundry, for which raw materials were imported. Anderson acquired agencies for a range of equipment imports; in particular, Aveling and Porter traction engines and road rollers... In the next decade the firm began to manufacture steam boilers and also made equipment to process the province’s primary products, especially wool, flax and livestock.167

With a successful business and expanding share portfolio, the elder John Anderson’s wealth quickly grew. This enabled him to send the younger John Anderson, along with his brother Andrew, to Glasgow for their formal education in 1866. John the younger returned to New Zealand in 1873, followed three years later by Andrew, and both took up a role in the family business. The Beaumont Bridge was the first major project undertaken by John Anderson the younger, with his father acting only as guarantor.168 Following the success of the project, the Anderson brothers went on to establish one of New Zealand’s most important construction companies of the era.169

In particular, it gained a reputation for building road and rail bridges.... Alluvial gold dredges were also built, and vessels were constructed and repaired at the Lyttelton works, which opened in 1887. Local expertise for large-scale projects was regarded as suspect but the firm undertook major contracts, including the impressive viaducts at Waiteti (1888) [Figure 41] and Makatote (1908) on the main trunk railway, and the manufacture of the steel lighthouse for Farewell Spit (1895–96). In 1903 a private limited liability company, Anderson’s Limited, was formed. It merged with Mason Brothers Limited in 1964 and ceased trading in 1986.170

The works of the Anderson brothers remain some of the most enduring examples of visionary engineering of the era.

2.4 Archaeological Sites

There are six NZAA registered sites within a 1,000km radius of the Beaumont Bridge (Figure 42).

Five sites lie north of the bridge. Four of these sites – G44/64, G44/86, G44/88 and G44/143 – are associated with the dredging of the river and mining for gold, including the remains of two huts. Site G44/87 encompasses the remains of stone abutments of the Beaumont Creek Bridge. Two sites lie southeast of the bridge, both of which are associated with pre-European occupation of the area. G44/3 is the site of several ovens estimated to date to the mid-18th century. G44/4 marks the location of an artefact find: a Maori adze discovered by the property owner in 1966.
3 Assessment of Heritage Significance

3.1 Methodology for Assessing Cultural Heritage Significance

3.1.1 Categories of Significance

Identifying and assessing heritage values can be a complex process. At present there is no legislative procedure or established common methodology for assessing the heritage significance of a place in New Zealand; however, there are a variety of precedents and guidelines. Those precedents and guidelines that are considered to be particularly relevant to the New Zealand context, or are considered to be respected international precedents, are outlined below.

3.1.1.1 ICOMOS New Zealand Charter for the Conservation of Places of Cultural Heritage Value, Revised 2010

The ICOMOS New Zealand Charter for the Conservation of Places of Cultural Heritage Value, Revised 2010 (ICOMOS NZ Charter) sets out principles to guide the conservation of places of cultural heritage value in New Zealand.

Under the ICOMOS NZ Charter, a place is considered to have cultural heritage significance where it possesses:

... aesthetic, archaeological, architectural, commemorative, functional, historical, landscape, monumental, scientific, social, spiritual, symbolic, technological, traditional, or other tangible or intangible values, associated with human activity.\(^\text{171}\)

Article 2 of the ICOMOS NZ Charter states that, in assessing the significance of a place, all aspects of cultural heritage value should be considered and understood, even where these values differ or conflict. The ICOMOS NZ Charter identifies authenticity and integrity as crucial aspects of cultural heritage value. Definitions of these terms can be found in the Charter, provided in Appendix 1.

3.1.1.2 Resource Management Act 1991

The purpose of the Resource Management Act 1991 (RMA) is to promote sustainable management of natural and physical resources in New Zealand, which includes historic heritage. The RMA requires local authorities to identify and protect historic heritage within their jurisdiction, where historic heritage is defined as:

a) those natural and physical resources that contribute to an understanding and appreciation of New Zealand’s history and cultures, deriving from any of the following qualities:
   (i) archaeological;
   (ii) architectural;
   (iii) cultural;
   (iv) historic;
   (v) scientific;
   (vi) technological.\(^\text{172}\)

\(^{171}\) ICOMOS NZ (2010)
\(^{172}\) RMA 1991 section 2. And includes:
   (i) historic sites, structures, places, and areas; and
   (ii) archaeological sites; and
3.1.1.3 Heritage New Zealand Pouhere Taonga Act 2014

The purpose of the Heritage New Zealand Pouhere Taonga Act 2014 (HNZPTA) is to promote the identification, protection, preservation, and conservation of the historical and cultural heritage of New Zealand. The HNZPTA identifies criteria for establishing significance that are used to establish whether or not a place may be assigned Category I or II status on the New Zealand Heritage List as follows:

a) the extent to which the place reflects important or representative aspects of New Zealand history;
b) the association of the place with events, persons, or ideas of importance in New Zealand history;
c) the potential of the place to provide knowledge of New Zealand history;
d) the importance of the place to tangata whenua;
e) the community association with, or public esteem for, the place;
f) the potential of the place for public education;
g) the technical accomplishment, value, or design of the place;
h) the symbolic or commemorative value of the place;
i) the importance of identifying historic places known to date from an early period of New Zealand settlement;
j) the importance of identifying rare types of historic places;
k) the extent to which the place forms part of a wider historical and cultural area.173

3.1.1.4 Clutha District Council

The RMA requires all territorial authorities to prepare a district plan to assist them in carrying out their functions in order to achieve the sustainable management purpose of the RMA.174 One of these functions is the identification of historic heritage resources, and the protection of these resources from inappropriate subdivision, use, and development.175

Buildings and structures identified and protected for their cultural heritage value under the operative Clutha District Plan are listed in Chapter 3.5, Table 13.1: Register of Heritage Buildings. The District Plan does not provide a set of criteria by which the buildings and structures included in the Register have been evaluated. Section 3.5.5 states that the Register includes buildings on the New Zealand Heritage List, and other buildings and structures “identified by the Council through public consultation”.

3.1.1.5 Otago Regional Policy Statement

The RMA requires every region to prepare a regional policy statement that provides an overview of issues surrounding the use of natural and physical resources of the region; and set out policies to, and methods of, managing these resources.176

---

173 HNZPTA 2014 section 66
174 RMA 1991 section 72
175 RMA 1991 section 6
176 RMA 1991 section 59
Chapter 9 of the Otago Regional Policy Statement (RPS) sets out the issues, objectives and policies of the Otago Regional Council that relate to the built environment.

Policy 9.5.6 of the Otago Regional Policy Statement (RPS) aims to recognise and protect Otago’s regionally significant heritage sites by:

a) identifying Otago’s regionally significant heritage sites in consultation with Otago’s communities; and
b) developing means to ensure those sites are protected from inappropriate subdivision, use and development ...

where “heritage site” is defined in Chapter 16: Appendix as:

any place or object of special cultural, architectural, historical, scientific, ecological or other interest, or of special significance to the tangata whenua for spiritual, cultural or historical reason.177

3.1.1.6 New Zealand Transport Agency Guidelines

In 2015, the NZ Transport Agency published a guidance document entitled Historic Heritage Impact Assessment Guide for State Highway Projects. This document identifies the following criteria for assessment of heritage significance:

Physical Values  
archaeological information  
architecture  
technology and engineering  
scientific  
rarity  
representativeness  
integrity  
vulnerability  
context or group

Historic Values  
people  
events  
patterns

Cultural Values  
identity  
public esteem  
commemorative  
education  
tangata whenua  
statutory recognition178

177 “Archaeological site” is defined in Chapter 16 as per the HNZPTA.
3.1.2 Degree of Significance

To assess the degree of each significance associated with the Beaumont Bridge and its immediate setting, the following graduated scale has been used:

**Exceptional**
The structure and/or site has exceptionally high value in respect of the criteria considered.

**High**
The structure and/or site has high value in respect of the criteria considered.

**Moderate**
The structure and/or site has moderate value in respect of the criteria considered.

**Little or None**
The structure and/or site has little or no value in respect of the criteria considered.

3.2 Assessment of Cultural Heritage Significance

This section provides an assessment of heritage significance of the Beaumont Bridge based on the criteria set down in the documents outlined in Section 3.1; particularly those in the RMA and the *Historic Heritage Impact Assessment Guide for State Highway Projects*.

3.2.1 Archaeological Significance

*The place has the potential to contribute information about human history of the region, or current archaeological research questions, through investigation using archaeological methods; or is known to date from an early period of New Zealand settlement.*

The site of the Beaumont Bridge has known associations with Maori settlement dating from the 13th century, and European settlement dating from the mid-19th century. There are several recorded NZAA sites in the vicinity of the bridge, and the bridge itself is a pre-1900 structure. It is evident, therefore, that the bridge and surrounding area has the potential to contribute considerable information about the human history of the region through archaeological investigation; and may directly inform a growing body of knowledge regarding pre-European occupation of Central Otago. It is therefore considered that the Beaumont Bridge and surrounding area have high, and possibly exceptional, archaeological value. This should be further investigated by way of an archaeological assessment.

3.2.2 Architectural or Aesthetic Significance

*Is the place or area a good example of its type in terms of design, form, features, scale, style, materials or ornamentation; has integrity, retaining significant features from its time of construction, or later periods when important modifications were made.*

Although the Beaumont Bridge has been altered as part of strengthening and maintenance works carried out over the last 50 years, the Beaumont Bridge remains a well preserved example of a pre-1900 iron lattice-girder road bridge that retains its original features and scale, and much of its original fabric. The structure is simple and clean, with no embellishment or ornamentation. However, the elegantly designed and constructed iron lattice girders, and the commanding concrete piers and abutments are strong aesthetic features, and these remain largely intact. Where
repairs have been made these have been carried out with the objective of preserving overall aesthetic value. While they have arguably altered the appearance of the bridge, king post trusses added to strengthen the transoms were sensitively designed, and may now be considered an important feature of the structure. In this respect, it may be considered that the bridge has high aesthetic value.

### 3.2.3 Contextual or Landmark Significance

The place is part of a wider historical area such as a group of heritage places, a landscape, a townscape or setting; holds visual appeal as a point of special interest or landmark.

The position of Beaumont Bridge in the gorge and its elevation above the riverbed give the structure prominence within the landscape, especially when viewed on approach from the south. The bridge is by far the strongest and most easily recognisable structure within the Beaumont settlement; the second being the Beaumont Hotel. Occupying the site of the earlier Bridge Hotel, the proximity of this building to the bridge is contextually significant, as the two have always been intrinsically connected. It is therefore considered that the Beaumont Bridge has exceptional contextual and landmark value.

### 3.2.4 Cultural or Spiritual Significance

The place is important to tangata whenua; representative of community, regional or national identity; is held in high public esteem or sentiment; provides evidence of cultural or historical continuity; holds symbolic or commemorative value; is the focus for religious, political or other cultural activity.

This Heritage Significance Assessment does not present the views or history of tangata whenua regarding the cultural significance of the place as these views can only be expressed by tangata whenua themselves.

Having stood and remained in use for 130 years, the Beaumont Bridge certainly provides evidence of cultural or historical continuity since the time of European settlement in the area. While it is evident that the structure is not necessarily held in high public esteem – this being associated with perceived safety issues and regular closing of the bridge for maintenance works – it is also evident that the Beaumont community has a strong sense of identity, and wishes to preserve its history. This is clear when reading the websites of community groups such as Hands off Beaumont that formed to protest the ongoing threat of flooding of the town for construction of hydroelectric dams. Therefore, while the bridge is not the focus of cultural or spiritual activity, and is the subject of some negative sentiment, it is never-the-less considered that the structure has high cultural value due to its associations with a strong community identity and connection with the past.

### 3.2.5 Historic or Social Significance

The place is associated with an important event in local, regional or national history; a well-known or important individual, group or organisation; reflects or represents important aspects, themes or ideas of local, regional or national history.

As the history of both the Beaumont Bridge and the wider Beaumont township given in this Assessment demonstrate, the bridge is integral to the development of Beaumont and the wider area. The extant bridge is intrinsically connected with the establishment of a punt, and the bridge that preceded it, which in turn drove the establishment of a settlement in this location. As a
township, Beaumont has played a crucial role in the opening up of the Upper Clutha to both road and rail. The Beaumont Bridge has associations with important individuals who were influential on a national level, including two leading PWD engineers and the pioneering contractor and businessman, John Anderson. Considering these factors, it is evident that the Beaumont Bridge has exceptional historic value.

3.2.6 Scientific Significance

The place has the potential to provide scientific information about the region or New Zealand; or to provide public education.

Taking into account the archaeological and technological significance of the Beaumont Bridge discussed in this section, it is evident that the bridge has considerable potential to contribute to scientific information about the local area, wider region, and New Zealand. There are also opportunities for public education that may be enhanced through installation of targeted interpretive material.

3.2.7 Technological Significance

The place demonstrates innovative or important methods of construction, engineering or materials; is an early example of the use of a particular construction technique; demonstrates technical accomplishment; or has the potential to contribute information about technological or engineering history.

As one of the first – and possibly the first - of four bridges constructed with wrought iron components assembled in New Zealand, the Beaumont Bridge embodies innovative methods of construction not previously used in the country. Anderson’s approach of bringing the raw material to the site and establishing a site foundry especially for construction was replicated with success on much larger projects.\(^{179}\) Believed to be the oldest bridge of its kind in New Zealand, and still in operation on the state highway network, the Beaumont Bridge contributes significant information about the technological and engineering history of both Otago and wider New Zealand. It is therefore considered that the Beaumont Bridge has exceptional technological value.

3.2.8 Comparative Analysis

The place, or features of the place, are a rare, unique or representative example in a local, regional or national context.

There are few road bridges still in operation in New Zealand that are directly comparable to the Beaumont Bridge. Those that have been identified in the course of research for this Assessment are outlined below. They are given in order from most to least similar.

The Iron Bridge just north of the small settlement of Lyell in the Upper Buller Gorge was opened in 1890. The design required special care due to the location, the height of the bridge being approximately 30m above the riverbed in an area subject to severe flooding. According to Thornton (2001) the ironwork was fabricated by Andersons in Christchurch, shipped from Lyttelton to Westport, and carted to the site where it was assembled in a similar manner to the

\(^{179}\) IPENZ (nd b) www.ipenz.org.nz
Beaumont Bridge. The piers are masonry, founded on concrete-filled cast iron cylinders; and the deck is timber. It is a single-lane bridge, and traffic lights have been installed at either end.

The Iron Bridge suffered damage in the Murchison and Inangahua earthquakes, but remains standing and operational as a road bridge. Of the comparisons considered in this section, the Iron Bridge is the most similar to the Beaumont Bridge. It is not listed with HNZPT.

![Iron Bridge, Lyell](www.flickr.com)

The Taramakau Bridge is a combined road and rail bridge on SH6. The following information is extracted from an archaeological assessment for works relating to the bridge prepared by O’Connell (2016):

In 1879 the government began the Greymouth-Hokitika railway. Its construction necessitated the building of a railway bridge spanning the Taramakau River. The Public Works Department designed the bridge and by 1887 it was under construction ... Construction was carried out by the Scott Brothers Atlas foundry of Christchurch, an engineering and manufacturing firm, and it was completed in 1889 ... The Taramakau Bridge is a combined road-rail bridge comprising six steel through truss spans of a double lattice design. It has a concrete abutment at either end of five piers, each pier consisting of two cast iron cylinders.\(^{180}\)

Taramakau Bridge is not listed with HNZPT.

---

\(^{180}\) O’Connell (2016)
Bridge 135 over the Taieri River is listed as a Category II structure on the New Zealand Heritage list. The following information is extracted from the listing information given by HNZPT on their website:

The bridge over the Taieri River on the Hyde-Macraes Road was built in 1879. The bridge was constructed as the result of community agitation; the Taieri River could be dangerous in flood, and the upper Taieri area was isolated. The bridge provided safe crossing and a stable connection with the outside communities. The bridge is a testament to the design and work of the County Engineer Robert Browne... [It] has an iron lattice truss for the main span and short timber arch trusses at either end. The piers and abutments are stone. It was adapted to the site by the addition of a 30 ft (9.1m) span at each end, to give a total length of 160ft (48.7m). The deck is 30 ft (9.1m) above water level ... [and] remains a notable landmark ... According to historian Janet Cowan, the iron truss was fabricated in Dunedin. The bridge has been strengthened and some of the decking replaced since its construction.181

Bridge 135 exhibits some structural elements similar to the Beaumont Bridge; however, the two structures are quite different in size and design.

---

181 HNZPT (nd) www.heritage.org.nz
These comparisons clearly demonstrate that the Beaumont Bridge one of the only remaining, and certainly the oldest, bridge of its type in New Zealand and is therefore unique in a local, regional and national context.

3.2.9 Vulnerability

The structure is vulnerable to deterioration or destruction or is it threatened by adjacent activities.

Over the course of 130 years of life, the Beaumont Bridge has withstood harsh environmental conditions and severe weather events including major floods; and has continued – albeit with regular inspections and maintenance – to stand up to traffic loads and use well beyond that for which it was designed. This is a testament to the quality of the design and materials, and resilience of the structure. However, it is clear that the current use of the bridge leaves it vulnerable to rapid deterioration.

In this respect, the Beaumont Bridge is also vulnerable to destruction resulting from replacement – whether this be as a direct result of demolition to construct a new bridge in its place; or as a result of the bridge being superseded and becoming redundant. It is therefore necessary to consider how future development can be carried out to address the vulnerability of this significant structure.
3.3 Methodology for Assessing Fabric Significance

3.3.1 Degree of Significance

To assess the degree of each significance associated with the fabric of the Beaumont Bridge, the following graduated scale is used:

**Exceptional Significance (A)**
The element has a primary role in understanding the heritage significance of the place.

**High Significance (B)**
The element has a secondary role in understanding the heritage significance of the place.

**Moderate Significance (C)**
The element plays a minor role in understanding the heritage significance of the place.

**Little or No Significance (N)**
The element makes little or no contribution in understanding the significance of the place, but is not intrusive or negative.

**Intrusive (I)**
The element is unsympathetic to, and has an adverse effect on, the heritage significance of the place.

3.3.2 Degree of Authenticity

As defined by the ICOMOS NZ Charter, “authenticity” refers to the credibility or truthfulness of the surviving evidence and knowledge of the cultural heritage value of a place. Assessment of authenticity is based on identification and analysis of the evidence and knowledge gathered in this Conservation Plan.

Similar to the degree of significance, the levels of authenticity are assessed using the following graduated scale:

**Exceptional Authenticity**
The element is known to be original and/or provides exceptionally credible or truthful evidence of cultural heritage values through form, fabric, technology, use or setting.

**High Authenticity**
The element is known to be historic and/or contributes to credible or truthful evidence of cultural heritage values through form, fabric, technology, use or setting.

**Some Authenticity**
The element is recent fabric and/or makes a limited contribution evidence of cultural heritage values of the structure in its form, fabric, technology, use or setting.

**Little or No Authenticity**
The element is recent fabric and/or makes no contribution to evidence of cultural heritage values of the structure in its form, fabric, technology, use or setting.
### 3.4 Assessment of Fabric Significance

An assessment of significance and authenticity of the fabric of the Beaumont Bridge is provided in Table 1.

#### Table 1: Cultural Heritage Significance of Beaumont Bridge

<table>
<thead>
<tr>
<th>Element</th>
<th>Sig.</th>
<th>Reason</th>
<th>Auth.</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>Concrete piers and abutments</td>
<td>A</td>
<td>These elements are representative of the original design of the bridge. While arguably not as recognisable or technologically interesting as the superstructure, these elements play a primary role in understanding the significance of the bridge.</td>
<td>Exceptional</td>
<td>The concrete piers and abutments are effectively unchanged since their construction, with the exception of some minor alterations to substructural junctions. The piers remain in good condition; however the abutments, particularly the west abutment, are in a poor state of repair. Despite this, they continue to provide exceptionally credible evidence of the value of the structure.</td>
</tr>
<tr>
<td>Cast iron lattice girders, transoms, tie backs, and horizontal cross braces</td>
<td>A</td>
<td>These elements are the most recognisable and are of the greatest technological interest, therefore playing a primary role in understanding the significance of the structure.</td>
<td>Exceptional</td>
<td>Although repairs have been made to the ironwork, especially in recent years, these have been carried out with a reasonable level of sympathy to the original design and these elements continue to provide exceptionally credible evidence of the value of the structure.</td>
</tr>
<tr>
<td>King post trusses strengthening transoms</td>
<td>B</td>
<td>These elements are part of the history of the structure and play a role in understanding how it has been impacted by its use in the course of its life and therefore play an important role in understanding the significance of the structure.</td>
<td>Some</td>
<td>When considered in relation to the life of the bridge, these elements are recent fabric that alter its design and appearance. However, they are evidence of the ways in which the original form of the bridge has been challenged by increased use.</td>
</tr>
<tr>
<td>Timber bearers</td>
<td>B</td>
<td>Though it is understood that the original bearers have been replaced, the size and material (timber) replicates the original and these elements continue to</td>
<td>High</td>
<td>Documentary research indicates that bearers have been replaced over the lifetime of the bridge, but the extent of this replacement is unknown. However, these elements</td>
</tr>
</tbody>

3.5 Statement of Significance

Opening in 1887, the Beaumont Bridge was one of the first bridges with a wrought iron superstructure fabricated in New Zealand. Erected in the location of a punt that formed part of a vital access route into the Upper Clutha, in place of an earlier bridge that had washed away, the Beaumont Bridge has exceptional historic value that is intrinsically tied to the development of the Beaumont settlement. This historic value is heightened by connections to prominent PWD engineers and contractors who were influential across the country. While the structure is simple, it is well executed, and retains much of its original fabric. Where additions or repairs have been made, these have been carried out with sympathy to the original design, and have become an important part of the extant structure which has high architectural significance. At 130 years old, and believed to be the oldest road bridge of its kind remaining in New Zealand, the Beaumont Bridge is a vital contributor to our national engineering history, and has the potential, through further investigation and interpretive material, to be a source of greater archaeological understanding of the area as well as public education.
4 Future Use Considerations

4.1 Statutory Requirements

4.1.1 Clutha District Plan

The primary piece of legislation currently governing the future management of the Beaumont Bridge is the operative Clutha District Plan. Issues, objectives and policies regarding the identification, management and protection of heritage items are identified in Chapter 3.5 of the Plan. This chapter identifies that poorly executed modification or demolition of significant historic buildings, structures, precincts and streetscapes has occurred as a result of a general lack of awareness and appreciation of historic values leading to a loss of cultural heritage within the district.\(^{182}\) To prevent this from continuing to occur, Section 3.5.3 sets out objectives and policies to guide the use and development of built heritage, including:\(^{183}\)

- Policy HER.4 To conserve the heritage values of those buildings and structures, identified in the Register of Heritage Items (given in Table 13.1 of the Plan)
- Policy HER.7 To encourage the retention, preservation and reuse of the District’s built heritage
- Policy HER.8 To protect significant cultural heritage items which are not protected by the provisions of the Historic Places Act 1993

Buildings and structures included in the Plan’s Register of Heritage Items, these objectives and policies are implemented through Rule HER.1 set out in Section 3.5.4 as follows:

(i) **Redecoration or restoration of any original features, details or fabrics is a permitted activity**\(^{184}\) provided it is carried out in the same manner and design and with similar materials to those originally used and does not detract from the historical character of the registered item.

(ii) **Any alteration or addition proposed will first be considered as a non-notified restricted discretionary activity.** Council shall restrict the exercise of its discretion to matters of design, materials and colours used and any effect on the special character of the registered item. The written consent of the New Zealand Historic Places Trust [now Heritage New Zealand Pouhere Taonga] is required.\(^{185}\)

(iii) **Works which may modify, destroy or detract from the character of a registered building or structure shall be considered as a discretionary activity** which Council shall both, publicly notify and serve notice upon the New Zealand Historic Places Trust [now Heritage New Zealand Pouhere Taonga] and other such interested groups as it sees fit.

As the Beaumont Bridge forms part of SH8, it is also a Designated Site under the Clutha District Plan. As such, an Outline Plan amendment, and not a Resource Consent, will be required for works where the use of the bridge remains the same – that is, if the bridge is to remain open to road

\(^{182}\) Clutha District Plan, Section 3.5.2

\(^{183}\) Clutha District Plan, Section 3.5.2

\(^{184}\) Permitted Activities do not require a Resource Consent.

\(^{185}\) It would appear from the wording of this Section that written consent of HNZPT is required regardless of whether or not the item is included on the New Zealand Heritage List.
traffic. However, under Section 176A (3) (f) of the Council is required to consider under ‘other matters’ when assessing an Outline Plan application; and one of these other matters is heritage. It is therefore likely that the Council will consider an Outline Plan application using the same criteria as it would in assessing an application for Resource Consent. Where the use of the bridge is to change, a Resource Consent may be required. This requires further investigation and advice from an appropriately qualified planner.

4.1.2 Building Act 2004

The Building Act 2004 regulates all buildings and structures to safeguard the health, safety, and amenity of people, facilitate efficient energy use, and to protect property from damage. The key regulatory tool is the New Zealand Building Code (the Code).

For the purposes of the Building Code, “buildings” are classified according to type in Clause A1. Bridges are considered to be ancillary buildings, defined as:

a building or use not for human habitation and which may be exempted from some amenity provisions, but which are required to comply with structural and safety-related aspects of the building code.  

In administering its functions under the Building Act, a territorial authority can adopt a flexible approach to heritage structures. The Act states that the territorial authority shall have due regard to any special historical or cultural value of a building.

Currently the Building Act links with the HNZPTA through Project Information Memoranda (PIMs) and building consent processes. These links provide an ‘early warning system’ to enable HNZPT to fulfil its statutory function to advocate for the protection of historical and cultural heritage in the public interest.

4.1.3 Heritage New Zealand Pouhere Taonga Act 2014

The HNZPTA:

... makes it unlawful for any person to modify or destroy, or cause to be modified or destroyed, the whole or any part of an archaeological site without the prior authority of Heritage New Zealand. This is the case regardless of whether the land on which the site is located is designated, or the activity is permitted under the District or Regional Plan or a resource or building consent has been granted. The Act provides for substantial penalties for unauthorised destruction or modification.  

Any person wishing to undertake work that may damage, modify or destroy an archaeological site must first obtain an authority from the Heritage New Zealand for that work.

Archaeological Site is defined in Section 6 of the Act as

any place in New Zealand, including any building or structure (or part of a building or structure), that—

---

186 NZBC A1 8.0
187 www.historic.org.nz
188 www.historic.org.nz
i. was associated with human activity that occurred before 1900 or is the site of the wreck of any vessel where the wreck occurred before 1900; and

ii. provides or may provide, through investigation by archaeological methods, evidence relating to the history of New Zealand.

Under this definition, works affecting the Beaumont Bridge, and much of the wider Beaumont area, will require an Archaeological Authority. This requires further investigation and advice from an appropriately qualified archaeologist.

4.2 Non-Statutory Requirements

4.2.1 The ICOMOS New Zealand Charter for the Conservation of Places of Cultural Heritage Value (Revised 2010)

The ICOMOS NZ Charter provides a set of policies to guide the conservation and adaptation of places of cultural heritage value. The Charter is provided in full in Appendix 1. In relation to the Beaumont Bridge, the following policies are of particular relevance:

- **Policy 5:** The removal or obscuring of any physical evidence of any period or activity should be minimised, and should be explicitly justified where it does occur.

- **Policy 6:** Intervention should be the minimum necessary to ensure the retention of tangible and intangible values and the continuation of uses integral to those values. The removal of fabric or the alteration of features and spaces that have cultural heritage value should be avoided.

- **Policy 9:** Where the setting of a place is integral to its cultural heritage value, that setting should be conserved with the place itself.

- **Policy 18:**
  - i. Stabilisation
    Processes of decay should be slowed by providing treatment or support.
  - ii. Maintenance
    A place of cultural heritage value should be maintained regularly. Maintenance should be carried out according to a plan or work programme.
  - iii. Repair
    Repair of a place of cultural heritage value should utilise matching or similar materials... Traditional methods and materials should be given preference in conservation work. Repair of a technically higher standard than that achieved with the existing materials or construction practices may be justified only where the stability or life expectancy of the site or material is increased, where the new material is compatible with the old, and where the cultural heritage value is not diminished.

- **Policy 19:**
  - ii. Removal
    Occasionally, existing fabric may need to be permanently removed from a place. This may be for reasons of advanced decay, or loss of structural integrity, or because particular fabric has been identified in a conservation plan as deterring from the cultural heritage value of the place.
• Policy 21: The conservation of a place of cultural heritage value is usually facilitated by the place serving a useful purpose. Proposals for adaptation of a place may arise from maintaining its continuing use, or from a proposed change of use.

• Policy 23: Where appropriate, interpretation should [be put in place to] assist the understanding of tangible and intangible values of a place which may not be readily perceived, such as the sequence of construction and change, and the meanings and associations of the place for connected people. Any interpretation should respect the cultural heritage value of a place.

• Policy 24: Places of cultural heritage value may be vulnerable to natural disasters such as flood, storm, or earthquake; or to humanly induced threats and risks such as those arising from earthworks, subdivision and development, buildings works, or wilful damage or neglect. In order to safeguard cultural heritage value, planning for risk mitigation and emergency management is necessary.

4.2.2 New Zealand Transport Agency Bridge Manual

The NZ Transport Agency Bridge Manual sets out the criteria for the design and evaluation of bridges, including bridges of reinforced concrete construction carrying pedestrian traffic.\(^{189}\) It includes performance specifications for durability, structural performance, access and safety.

---

\(^{189}\) NZ Transport Agency (2016b) p1-2
5 Conclusion and Recommendations

The Beaumont Bridge has high archaeological, aesthetic and cultural value; and exceptional historic, contextual, and technological value. The settlement of Beaumont also has high cultural, archaeological, historic and social value.

It is understood that the Detailed Business Case for which this Heritage Significance Assessment has been prepared will focus on the likelihood that a new road bridge will be constructed, and the highway approaches realigned to suit. Considering this likely outcome, the following recommendations are made:

- The Beaumont Bridge should be retained. While demolition of the Beaumont Bridge is not prohibited under current legislation, the exceptional significance and rarity of the structure mean that demolition should be ruled out as an option.

- A new use should be found for the Beaumont Bridge. It is evident that the ongoing maintenance required to maintain current use of the bridge as a roadway, particularly for HPMVs, is not sustainable. However, in removing the bridge from the state highway network, it is important that the bridge continue to be used to ensure that it does not become redundant. Options for adaptive reuse of the bridge should consider the various heritage significances of the extant structure. The bridge currently forms part of the Clutha Gold Trail which connects with the Otago Central Rail Trail and the Roxburgh Gorge Trail. These trails are well patronised and include a number of historic bridges that have been adapted for cycling. It is therefore considered that the most viable option for continuing use of the bridge is as a pedestrian and cycle way. This use would also be consistent with the historic origins of the bridge, which was designed to allow pedestrians and non-motorised transport to cross.

- Repair works necessary to make the bridge suitable for the selected alternative use without the need for permanent scaffolding should be carried out, including repair and restoration of the concrete abutments. A complete clean of the structure is also recommended.

- Replacement options for the Beaumont Bridge should consider the heritage significance of both the existing bridge and the Beaumont settlement. The design of any new bridge that is within proximity of the existing bridge should take into account the setting of the existing bridge as well as the layout of the existing township.

- A full and comprehensive Conservation Management Plan for the Beaumont Bridge should be prepared. This Plan should provide guidance on how to manage and maintain the bridge, and be prepared by an appropriately qualified heritage consultant for any and all proposed works that will affect the bridge.

- A full and comprehensive Archaeological Assessment should be prepared by an appropriately qualified archaeologist for any works to or around the bridge, or in the Beaumont area; this will be required for any Archaeological Authority Application.

ICOMOS New Zealand Charter for the Conservation of Places of Cultural Heritage Value (Revised 2010)
ICOMOS New Zealand Charter
for the Conservation of Places of Cultural Heritage Value

Revised 2010

Preamble

New Zealand retains a unique assemblage of places of cultural heritage value relating to its indigenous and more recent peoples. These areas, cultural landscapes and features, buildings and structures, gardens, archaeological sites, traditional sites, monuments, and sacred places are treasures of distinctive value that have accrued meanings over time. New Zealand shares a general responsibility with the rest of humanity to safeguard its cultural heritage places for present and future generations. More specifically, the people of New Zealand have particular ways of perceiving, relating to, and conserving their cultural heritage places.

Following the spirit of the International Charter for the Conservation and Restoration of Monuments and Sites (the Venice Charter - 1964), this charter sets out principles to guide the conservation of places of cultural heritage value in New Zealand. It is a statement of professional principles for members of ICOMOS New Zealand.

This charter is also intended to guide all those involved in the various aspects of conservation work, including owners, guardians, managers, developers, planners, architects, engineers, craftspeople and those in the construction trades, heritage practitioners and advisors, and local and central government authorities. It offers guidance for communities, organisations, and individuals involved with the conservation and management of cultural heritage places.

This charter should be made an integral part of statutory or regulatory heritage management policies or plans, and should provide support for decision makers in statutory or regulatory processes.

Each article of this charter must be read in the light of all the others. Words in bold in the text are defined in the definitions section of this charter.

This revised charter was adopted by the New Zealand National Committee of the International Council on Monuments and Sites at its meeting on 4 September 2010.

Purpose of conservation

1. The purpose of conservation

The purpose of conservation is to care for places of cultural heritage value.

In general, such places:

(i) have lasting values and can be appreciated in their own right;
(ii) inform us about the past and the cultures of those who came before us;
(iii) provide tangible evidence of the continuity between past, present, and future;
(iv) underpin and reinforce community identity and relationships to ancestors and the land; and
(v) provide a measure against which the achievements of the present can be compared.
It is the purpose of conservation to retain and reveal such values, and to support the ongoing meanings and functions of places of cultural heritage value, in the interests of present and future generations.

**Conservation principles**

2. **Understanding cultural heritage value**

Conservation of a place should be based on an understanding and appreciation of all aspects of its cultural heritage value, both tangible and intangible. All available forms of knowledge and evidence provide the means of understanding a place and its cultural heritage value and cultural heritage significance. Cultural heritage value should be understood through consultation with connected people, systematic documentary and oral research, physical investigation and recording of the place, and other relevant methods.

All relevant cultural heritage values should be recognised, respected, and, where appropriate, revealed, including values which differ, conflict, or compete.

The policy for managing all aspects of a place, including its conservation and its use, and the implementation of the policy, must be based on an understanding of its cultural heritage value.

3. **Indigenous cultural heritage**

The indigenous cultural heritage of tangata whenua relates to whanau, hapu, and iwi groups. It shapes identity and enhances well-being, and it has particular cultural meanings and values for the present, and associations with those who have gone before. Indigenous cultural heritage brings with it responsibilities of guardianship and the practical application and passing on of associated knowledge, traditional skills, and practices.

The Treaty of Waitangi is the founding document of our nation. Article 2 of the Treaty recognises and guarantees the protection of tino rangatiratanga, and so empowers kaitiakitanga as customary trusteeship to be exercised by tangata whenua. This customary trusteeship is exercised over their taonga, such as sacred and traditional places, built heritage, traditional practices, and other cultural heritage resources. This obligation extends beyond current legal ownership wherever such cultural heritage exists.

Particular matauranga, or knowledge of cultural heritage meaning, value, and practice, is associated with places. Matauranga is sustained and transmitted through oral, written, and physical forms determined by tangata whenua. The conservation of such places is therefore conditional on decisions made in associated tangata whenua communities, and should proceed only in this context. In particular, protocols of access, authority, ritual, and practice are determined at a local level and should be respected.

4. **Planning for conservation**

Conservation should be subject to prior documented assessment and planning.

All conservation work should be based on a conservation plan which identifies the cultural heritage value and cultural heritage significance of the place, the conservation policies, and the extent of the recommended works.

The conservation plan should give the highest priority to the authenticity and integrity of the place.
Other guiding documents such as, but not limited to, management plans, cyclical maintenance plans, specifications for conservation work, interpretation plans, risk mitigation plans, or emergency plans should be guided by a conservation plan.

5. Respect for surviving evidence and knowledge

Conservation maintains and reveals the authenticity and integrity of a place, and involves the least possible loss of fabric or evidence of cultural heritage value. Respect for all forms of knowledge and existing evidence, of both tangible and intangible values, is essential to the authenticity and integrity of the place.

Conservation recognises the evidence of time and the contributions of all periods. The conservation of a place should identify and respect all aspects of its cultural heritage value without unwarranted emphasis on any one value at the expense of others.

The removal or obscuring of any physical evidence of any period or activity should be minimised, and should be explicitly justified where it does occur. The fabric of a particular period or activity may be obscured or removed if assessment shows that its removal would not diminish the cultural heritage value of the place.

In conservation, evidence of the functions and intangible meanings of places of cultural heritage value should be respected.

6. Minimum intervention

Work undertaken at a place of cultural heritage value should involve the least degree of intervention consistent with conservation and the principles of this charter.

Intervention should be the minimum necessary to ensure the retention of tangible and intangible values and the continuation of uses integral to those values. The removal of fabric or the alteration of features and spaces that have cultural heritage value should be avoided.

7. Physical investigation

Physical investigation of a place provides primary evidence that cannot be gained from any other source. Physical investigation should be carried out according to currently accepted professional standards, and should be documented through systematic recording.

Invasive investigation of fabric of any period should be carried out only where knowledge may be significantly extended, or where it is necessary to establish the existence of fabric of cultural heritage value, or where it is necessary for conservation work, or where such fabric is about to be damaged or destroyed or made inaccessible. The extent of invasive investigation should minimise the disturbance of significant fabric.

8. Use

The conservation of a place of cultural heritage value is usually facilitated by the place serving a useful purpose.

Where the use of a place is integral to its cultural heritage value, that use should be retained.
Where a change of use is proposed, the new use should be compatible with the cultural heritage value of the place, and should have little or no adverse effect on the cultural heritage value.

9. Setting

Where the setting of a place is integral to its cultural heritage value, that setting should be conserved with the place itself. If the setting no longer contributes to the cultural heritage value of the place, and if reconstruction of the setting can be justified, any reconstruction of the setting should be based on an understanding of all aspects of the cultural heritage value of the place.

10. Relocation

The on-going association of a structure or feature of cultural heritage value with its location, site, curtilage, and setting is essential to its authenticity and integrity. Therefore, a structure or feature of cultural heritage value should remain on its original site.

Relocation of a structure or feature of cultural heritage value, where its removal is required in order to clear its site for a different purpose or construction, or where its removal is required to enable its use on a different site, is not a desirable outcome and is not a conservation process.

In exceptional circumstances, a structure of cultural heritage value may be relocated if its current site is in imminent danger, and if all other means of retaining the structure in its current location have been exhausted. In this event, the new location should provide a setting compatible with the cultural heritage value of the structure.

11. Documentation and archiving

The cultural heritage value and cultural heritage significance of a place, and all aspects of its conservation, should be fully documented to ensure that this information is available to present and future generations.

Documentation includes information about all changes to the place and any decisions made during the conservation process.

Documentation should be carried out to archival standards to maximise the longevity of the record, and should be placed in an appropriate archival repository.

Documentation should be made available to connected people and other interested parties. Where reasons for confidentiality exist, such as security, privacy, or cultural appropriateness, some information may not always be publicly accessible.

12. Recording

Evidence provided by the fabric of a place should be identified and understood through systematic research, recording, and analysis.

Recording is an essential part of the physical investigation of a place. It informs and guides the conservation process and its planning. Systematic recording should occur prior to, during, and
following any intervention. It should include the recording of new evidence revealed, and any fabric obscured or removed.

Recording of the changes to a place should continue throughout its life.

13. Fixtures, fittings, and contents

Fixtures, fittings, and contents that are integral to the cultural heritage value of a place should be retained and conserved with the place. Such fixtures, fittings, and contents may include carving, painting, weaving, stained glass, wallpaper, surface decoration, works of art, equipment and machinery, furniture, and personal belongings.

Conservation of any such material should involve specialist conservation expertise appropriate to the material. Where it is necessary to remove any such material, it should be recorded, retained, and protected, until such time as it can be reinstated.

Conservation processes and practice

14. Conservation plans

A conservation plan, based on the principles of this charter, should:

(i) be based on a comprehensive understanding of the cultural heritage value of the place and assessment of its cultural heritage significance;
(ii) include an assessment of the fabric of the place, and its condition;
(iii) give the highest priority to the authenticity and integrity of the place;
(iv) include the entirety of the place, including the setting;
(v) be prepared by objective professionals in appropriate disciplines;
(vi) consider the needs, abilities, and resources of connected people;
(vii) not be influenced by prior expectations of change or development;
(viii) specify conservation policies to guide decision making and to guide any work to be undertaken;
(ix) make recommendations for the conservation of the place; and
(x) be regularly revised and kept up to date.

15. Conservation projects

Conservation projects should include the following:

(i) consultation with interested parties and connected people, continuing throughout the project;
(ii) opportunities for interested parties and connected people to contribute to and participate in the project;
(iii) research into documentary and oral history, using all relevant sources and repositories of knowledge;
(iv) physical investigation of the place as appropriate;
(v) use of all appropriate methods of recording, such as written, drawn, and photographic;
(vi) the preparation of a conservation plan which meets the principles of this charter;
(vii) guidance on appropriate use of the place;
(viii) the implementation of any planned conservation work; (ix) the documentation of the conservation work as it proceeds; and
(x) where appropriate, the deposit of all records in an archival repository.

A conservation project must not be commenced until any required statutory authorisation has been granted.

16. Professional, trade, and craft skills

All aspects of conservation work should be planned, directed, supervised, and undertaken by people with appropriate conservation training and experience directly relevant to the project.

All conservation disciplines, arts, crafts, trades, and traditional skills and practices that are relevant to the project should be applied and promoted.

17. Degrees of intervention for conservation purposes

Following research, recording, assessment, and planning, intervention for conservation purposes may include, in increasing degrees of intervention:

(i) preservation, through stabilisation, maintenance, or repair;
(ii) restoration, through reassembly, reinstatement, or removal;
(iii) reconstruction; and (iv) adaptation.

In many conservation projects a range of processes may be utilised. Where appropriate, conservation processes may be applied to individual parts or components of a place of cultural heritage value.

The extent of any intervention for conservation purposes should be guided by the cultural heritage value of a place and the policies for its management as identified in a conservation plan. Any intervention which would reduce or compromise cultural heritage value is undesirable and should not occur.

Preference should be given to the least degree of intervention, consistent with this charter.

Re-creation, meaning the conjectural reconstruction of a structure or place; replication, meaning to make a copy of an existing or former structure or place; or the construction of generalised representations of typical features or structures, are not conservation processes and are outside the scope of this charter.

18. Preservation

Preservation of a place involves as little intervention as possible, to ensure its long-term survival and the continuation of its cultural heritage value.

Preservation processes should not obscure or remove the patina of age, particularly where it contributes to the authenticity and integrity of the place, or where it contributes to the structural stability of materials.

i. Stabilisation

Processes of decay should be slowed by providing treatment or support.
ii. Maintenance

A place of cultural heritage value should be maintained regularly. Maintenance should be carried out according to a plan or work programme.

iii. Repair

Repair of a place of cultural heritage value should utilise matching or similar materials. Where it is necessary to employ new materials, they should be distinguishable by experts, and should be documented. Traditional methods and materials should be given preference in conservation work.

Repair of a technically higher standard than that achieved with the existing materials or construction practices may be justified only where the stability or life expectancy of the site or material is increased, where the new material is compatible with the old, and where the cultural heritage value is not diminished.

19. Restoration

The process of restoration typically involves reassembly and reinstatement, and may involve the removal of accretions that detract from the cultural heritage value of a place.

Restoration is based on respect for existing fabric, and on the identification and analysis of all available evidence, so that the cultural heritage value of a place is recovered or revealed. Restoration should be carried out only if the cultural heritage value of the place is recovered or revealed by the process.

Restoration does not involve conjecture.

i. Reassembly and reinstatement

Reassembly uses existing material and, through the process of reinstatement, returns it to its former position. Reassembly is more likely to involve work on part of a place rather than the whole place.

ii. Removal

Occasionally, existing fabric may need to be permanently removed from a place. This may be for reasons of advanced decay, or loss of structural integrity, or because particular fabric has been identified in a conservation plan as detracting from the cultural heritage value of the place.

The fabric removed should be systematically recorded before and during its removal. In some cases it may be appropriate to store, on a long-term basis, material of evidential value that has been removed.

20. Reconstruction

Reconstruction is distinguished from restoration by the introduction of new material to replace material that has been lost.

Reconstruction is appropriate if it is essential to the function, integrity, intangible value, or understanding of a place, if sufficient physical and documentary evidence exists to minimise conjecture, and if surviving cultural heritage value is preserved.
Reconstructed elements should not usually constitute the majority of a place or structure.

21. Adaptation

The conservation of a place of cultural heritage value is usually facilitated by the place serving a useful purpose. Proposals for adaptation of a place may arise from maintaining its continuing use, or from a proposed change of use. Alterations and additions may be acceptable where they are necessary for a compatible use of the place. Any change should be the minimum necessary, should be substantially reversible, and should have little or no adverse effect on the cultural heritage value of the place.

Any alterations or additions should be compatible with the original form and fabric of the place, and should avoid inappropriate or incompatible contrasts of form, scale, mass, colour, and material. Adaptation should not dominate or substantially obscure the original form and fabric, and should not adversely affect the setting of a place of cultural heritage value. New work should complement the original form and fabric.

22. Non-intervention

In some circumstances, assessment of the cultural heritage value of a place may show that it is not desirable to undertake any conservation intervention at that time. This approach may be appropriate where undisturbed constancy of intangible values, such as the spiritual associations of a sacred place, may be more important than its physical attributes.

23. Interpretation

Interpretation actively enhances public understanding of all aspects of places of cultural heritage value and their conservation. Relevant cultural protocols are integral to that understanding, and should be identified and observed.

Where appropriate, interpretation should assist the understanding of tangible and intangible values of a place which may not be readily perceived, such as the sequence of construction and change, and the meanings and associations of the place for connected people.

Any interpretation should respect the cultural heritage value of a place. Interpretation methods should be appropriate to the place. Physical interventions for interpretation purposes should not detract from the experience of the place, and should not have an adverse effect on its tangible or intangible values.

24. Risk mitigation

Places of cultural heritage value may be vulnerable to natural disasters such as flood, storm, or earthquake; or to humanly induced threats and risks such as those arising from earthworks, subdivision and development, buildings works, or wilful damage or neglect. In order to safeguard cultural heritage value, planning for risk mitigation and emergency management is necessary.

Potential risks to any place of cultural heritage value should be assessed. Where appropriate, a risk mitigation plan, an emergency plan, and/or a protection plan should be prepared, and implemented as far as possible, with reference to a conservation plan.
Definitions

For the purposes of this charter:

**Adaptation** means the process(es) of modifying a place for a compatible use while retaining its cultural heritage value. Adaptation processes include alteration and addition.

**Authenticity** means the credibility or truthfulness of the surviving evidence and knowledge of the cultural heritage value of a place. Relevant evidence includes form and design, substance and fabric, technology and craftsmanship, location and surroundings, context and setting, use and function, traditions, spiritual essence, and sense of place, and includes tangible and intangible values. Assessment of authenticity is based on identification and analysis of relevant evidence and knowledge, and respect for its cultural context.

**Compatible use** means a use which is consistent with the cultural heritage value of a place, and which has little or no adverse impact on its authenticity and integrity.

**Connected people** means any groups, organisations, or individuals having a sense of association with or responsibility for a place of cultural heritage value.

**Conservation** means all the processes of understanding and caring for a place so as to safeguard its cultural heritage value. Conservation is based on respect for the existing fabric, associations, meanings, and use of the place. It requires a cautious approach of doing as much work as necessary but as little as possible, and retaining authenticity and integrity, to ensure that the place and its values are passed on to future generations.

**Conservation plan** means an objective report which documents the history, fabric, and cultural heritage value of a place, assesses its cultural heritage significance, describes the condition of the place, outlines conservation policies for managing the place, and makes recommendations for the conservation of the place.

**Contents** means moveable objects, collections, chattels, documents, works of art, and ephemera that are not fixed or fitted to a place, and which have been assessed as being integral to its cultural heritage value.

**Cultural heritage significance** means the cultural heritage value of a place relative to other similar or comparable places, recognising the particular cultural context of the place.

**Cultural heritage value/s** means possessing aesthetic, archaeological, architectural, commemorative, functional, historical, landscape, monumental, scientific, social, spiritual, symbolic, technological, traditional, or other tangible or intangible values, associated with human activity.

**Cultural landscapes** means an area possessing cultural heritage value arising from the relationships between people and the environment. Cultural landscapes may have been designed, such as gardens, or may have evolved from human settlement and land use over time, resulting in a diversity of distinctive landscapes in different areas. Associative cultural landscapes, such as sacred mountains, may lack tangible cultural elements but may have strong intangible cultural or spiritual associations.

**Documentation** means collecting, recording, keeping, and managing information about a place and its cultural heritage value, including information about its history, fabric, and meaning; information about decisions taken; and information about physical changes and interventions made to the place.
**Fabric** means all the physical material of a **place**, including subsurface material, **structures**, and interior and exterior surfaces including the patina of age; and including fixtures and fittings, and gardens and plantings.

**Hapu** means a section of a large tribe of the **tangata whenua**.

**Intangible value** means the abstract **cultural heritage value** of the meanings or associations of a **place**, including commemorative, historical, social, spiritual, symbolic, or traditional values.

**Integrity** means the wholeness or intactness of a **place**, including its meaning and sense of **place**, and all the **tangible** and **intangible** attributes and elements necessary to express its **cultural heritage value**.

**Intervention** means any activity that causes disturbance of or alteration to a **place** or its **fabric**. Intervention includes archaeological excavation, invasive investigation of built **structures**, and any **intervention** for **conservation** purposes.

**Iwi** means a tribe of the **tangata whenua**.

**Kaitiakitanga** means the duty of customary trusteeship, stewardship, guardianship, and protection of land, resources, or **taonga**.

**Maintenance** means regular and on-going protective care of a **place** to prevent deterioration and to retain its **cultural heritage value**.

**Matauranga** means traditional or cultural knowledge of the **tangata whenua**.

**Non-intervention** means to choose not to undertake any activity that causes disturbance of or alteration to a **place** or its **fabric**.

**Place** means any land having **cultural heritage value** in New Zealand, including areas; **cultural landscapes**; buildings, **structures**, and monuments; groups of buildings, **structures**, or monuments; gardens and plantings; archaeological sites and features; traditional sites; sacred **places**; townscape and streetscapes; and settlements. **Place** may also include land covered by water, and any body of water. **Place** includes the **setting** of any such **place**.

**Preservation** means to maintain a **place** with as little change as possible.

**Reassembly** means to put existing but disarticulated parts of a structure back together.

**Reconstruction** means to build again as closely as possible to a documented earlier form, using new materials.

**Recording** means the process of capturing information and creating an archival record of the **fabric** and **setting** of a **place**, including its configuration, condition, use, and change over time.

**Reinstatement** means to put material components of a **place**, including the products of **reassembly**, back in position.

**Repair** means to make good decayed or damaged **fabric** using identical, closely similar, or otherwise appropriate material.

**Restoration** means to return a **place** to a known earlier form, by **reassembly** and **reinstatement**, and/or by removal of elements that detract from its **cultural heritage value**.

**Setting** means the area around and/or adjacent to a **place** of **cultural heritage value** that is integral to its function, meaning, and relationships. **Setting** includes the **structures**, outbuildings, features, gardens, curtilage, airspace, and accessways forming the spatial context of the **place** or used in association with the **place**. **Setting** also includes **cultural landscapes**, townscape, and
streetscapes; perspectives, views, and viewshafts to and from a place; and relationships with other places which contribute to the cultural heritage value of the place. Setting may extend beyond the area defined by legal title, and may include a buffer zone necessary for the longterm protection of the cultural heritage value of the place.

Stabilisation means the arrest or slowing of the processes of decay.

Structure means any building, standing remains, equipment, device, or other facility made by people and which is fixed to the land.

Tangata whenua means generally the original indigenous inhabitants of the land; and means specifically the people exercising kaitiakitanga over particular land, resources, or taonga.

Tangible value means the physically observable cultural heritage value of a place, including archaeological, architectural, landscape, monumental, scientific, or technological values.

Taonga means anything highly prized for its cultural, economic, historical, spiritual, or traditional value, including land and natural and cultural resources.

Tino rangatiratanga means the exercise of full chieftainship, authority, and responsibility.

Use means the functions of a place, and the activities and practices that may occur at the place. The functions, activities, and practices may in themselves be of cultural heritage value.

Whanau means an extended family which is part of a hapu or iwi.

- **CONSTRUCTION**
SPAN 3, UPSTREAM BAY3a - REPLACE RIVET WITH TAPPED BOLT

DRILL OUT THE EXISTING RIVET, TAP OUT THE HOLE TO SUIT A M22 BOLT. INSTALL THE BOLT FROM THE OUTSIDE FACE WITH A LOCKING WASHER. DO NOT OVER-TIGHTEN (WE DO NOT WANT TO STRIP THE THREAD ON THE WROUGHT IRON.)
ABUTMENT A EXPANSION ALLOWANCE
(UPSTREAM AND DOWNSTREAM HOLD DOWN BOLTS)
(PROVISIONAL)

A rivet is missing on the top of the top chord. A M20 bolt shall be installed to replace the missing rivet. Total plate thickness is 3 mm.

Remove nut and washer from hold down bolts at Abutment A and cut a larger slotted hole in the base plate to allow the truss to slide back further towards the abutment back wall. Extend hole by approx. 50 mm. Extent to be confirmed on site by Engineer. Once nut and washer have been removed, reinstate washer and nut.

Extending slotted hole for bridge expansion.
