

Used vehicle importation process

Includes parallel imports of new vehicles.

Accurate and reliable information for vehicles imported into New Zealand is required for entry compliance. This includes new clean car regulations to support government initiatives on climate change, energy efficiency and energy conservation measures. The Fuelsaver system provides a way to assign your imported vehicle to your CO₂ account and determine before certification what the clean car account values will be. This diagram shows the lifecycle and touchpoints of importing a previously offshore registered vehicle (used import).
